1. Introduction

One of the biggest challenges our nation's transit agencies face is finding a way to increase ridership in light of limited revenues. As is the case with many American cities, large portions of Dallas and its adjacent suburban areas have a relatively low population density level, which may make travel by transit a less viable option.

As an indication of these preferences, population density has been growing near transit stations along the Dallas Area Rapid Transit (DART) Blue and Red lines in the cities of Dallas, Garland, Plano, and Richardson. As ridership increases, the effects of existing gaps in infrastructure or barriers to pedestrian and bicycle accessibility at DART stations becomes more evident. These barriers have the potential to suppress the demand for rail traffic, increase motorized traffic to and from the rail stations, or increase safety risks for the roadway's most vulnerable users.

Coordination between transit agencies and city transportation offices is necessary in targeting first and last mile improvements that produce the greatest benefits while planning for anticipated costs. In support of these efforts, the North Central Texas Council of Governments (NCTCOG) initiated this study to verify exiting needs and to prioritize identified improvements for twenty-eight stations and their adjacent developed areas within the cities of Dallas, Garland, Plano, and Richardson.

1.1 Objectives

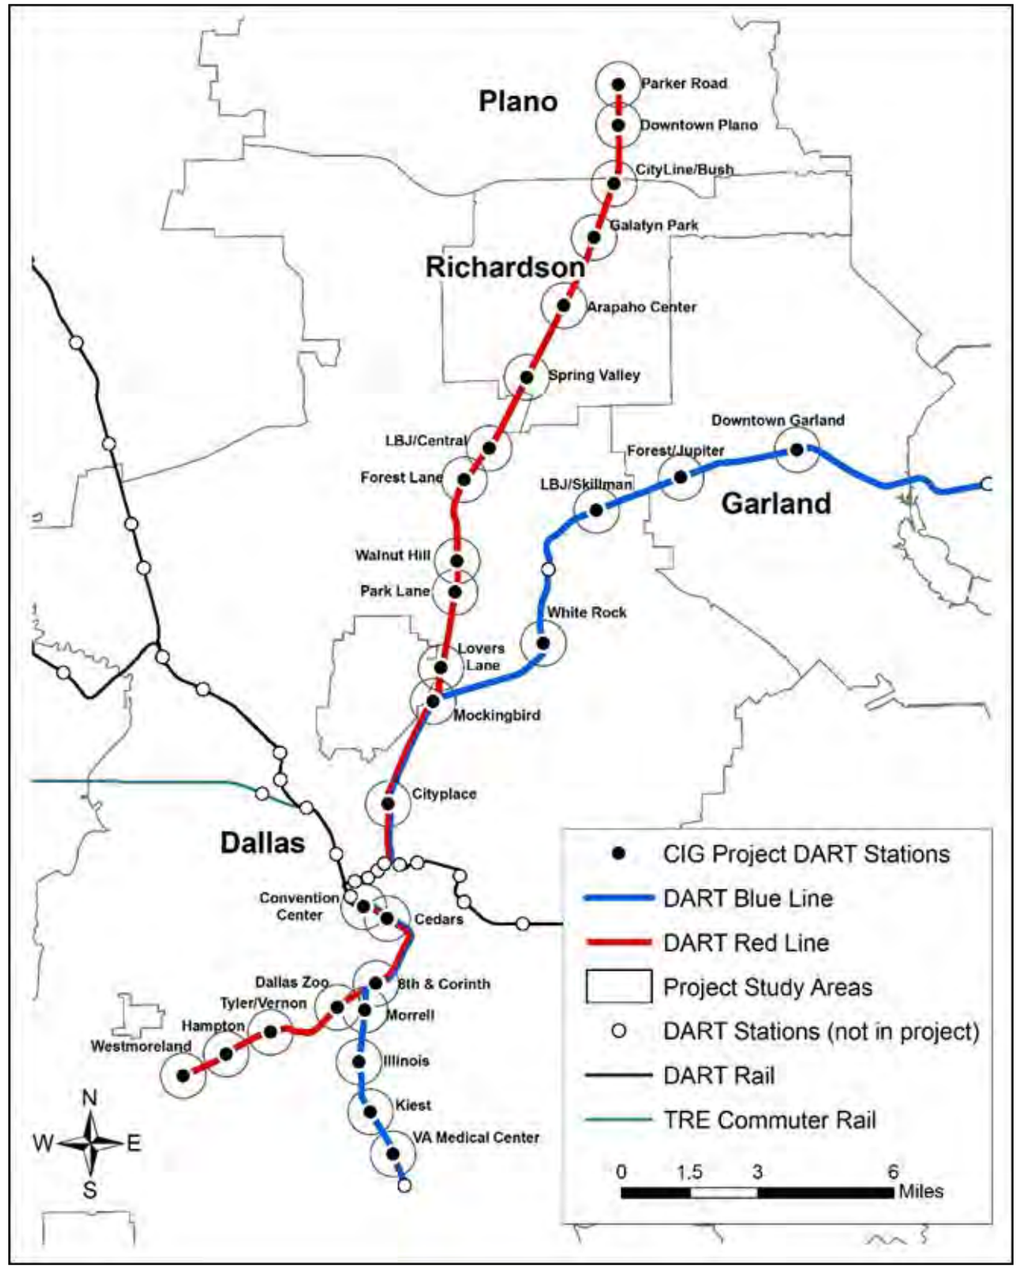
The project's objective is to provide opportunities for the greatest number of additional people to walk or bike to DART stations by identifying necessary sidewalk, shared use path, crosswalk connections, and related infrastructure within and surrounding the various DART stations. This was accomplished by:

- Conducting field investigation of existing pedestrian and bicycle infrastructure in the study area.
- Verifying the need for recommended pedestrian and bicycle improvements in priority corridors identified by NCTCOG to improve access and connectivity to light rail stations for the greatest number and density of residents and workers, thus increasing potential transit ridership.
- Identifying additional improvements based on field review, as necessary.
- Reviewing and updating NCTCOG's prior draft project prioritization of improvements based on information gathered during field review, engineering judgment, and criteria to be coordinated with City and DART staff stakeholders.
- Developing opinions of probable cost, and schematics for key pedestrian and bicycle improvements at rail stations and along prioritized routes to stations.

1.2 Study Area

The study area focused on the twenty-eight DART light rail stations built prior to 2004, included in the Red and Blue Line Platform Extension Project corridors, as shown in Figure 1.

Figure 1: Map of Study Area DART Stations



These stations are part of the Federal Transit Administration (FTA) Core Capacity Enhancement Capital Investment Grant, which made them eligible for FTA planning funds. Per FTA guidance, the one-half mile radius from the station is the effective planning area for transit-oriented development (TOD). These DART rail stations and their adjacent developed areas are located in the cities of Dallas, Garland, Plano, and Richardson.

While the intent of the planning work was to create corridor-level planning recommendations, not all areas surrounding all stations were reviewed using the same level of detail as part of this study; rather, strategic streets and sites within a broad selection of stations that were expected to be most cost effective were targeted for more thorough review.

1.3 Station Numbering & Report Organization

The system developed to organize improvements identified in the deliverables is illustrated in Figure 2. Each red or blue colored box in the figure represents a Red or Blue Line DART station respectively, arranged geographically from north to south. Purple boxes represent stations where the Red and Blue Lines run concurrently on the same alignment. Two-digit alpha-numeric codes assigned to each station are shown to the left of each box.

This report is organized for specific use by the City of Plano. Other volumes of this report have been provided to other project stakeholders (NCTCOG, DART, Dallas, Garland, and Richardson) which include similar details relevent to their jurisdictions. Figures common to all volumes of the report are numbered 1, 2, 3, etc. Figures specific to the City of Plano have figure numbers beginning with the code (1A, 1B, or 1C) assigned to each station.

1.4 Station Area Half-Mile Boundaries

The CityLine Bush station is the only station half-mile area in the project that is divided by a City boundary. As such, information about this station is repeated in both the Plano and Richardson versions of the report.

The half-mile radii of some stations overlap. In most cases, the overlapping areas were divided equally between the two (or three) station areas for ease of reporting.

In the case of the small overlap between the Parker Road and Downtown Plano Stations, the entire overlap area was assigned to Downtown Plano, due to the proximity to the terminus of the Red Line and the logical flow of ridership.

Figure 2: Project Station Numbering Schematic

City	Station ID	Red Line	Station ID	Blue Line
Plano	1A	Parker Road		
	1B	Downtown Plano		
	1C	City Line/Bush		
Richardson	2A	Galatyn Park		
	2B	Arapaho Center		
	2C	Spring Valley		
Garland			3A	**Downtown Garland***
			3B	**Forest/Jupiter***
Dallas	3C	LBJ/Central		
	3D	Forest Lane		
	4A	Walnut Hill		
	4B	Park Lane	4E	LBJ/Skillman
	4C	**Lovers Lane***	4F	White Rock
	4D	Mockingbird

	5B	**Dallas Zoo***	5C	Morrell
	6A	Tyler Vernon	7A	Illinois
	6B	Hampton	7B	Kiest
	6C	Westmoreland	7C	VA Medical Center

*** Station with high priority improvements for 15% design**

2. Methodology

The consultant group conducted field investigations for each of the twenty-eight DART station properties and surrounding one-half mile areas within the study area to examine existing conditions of pedestrian and bicycle infrastructure and to determine potential improvements. Field visits for each station were made between July 2018 and January 2019. Specific dates are listed in Appendix A.

2.1 Field Survey (DART Station Properties)

The consultant group documented the existing pedestrian, bicycle, bus, and motor vehicle circulation and patterns, as well as the wayfinding, signage, and lighting at each station. Potential station-area improvements were then identified, including sidewalks, curb cuts, crosswalks, shared use paths, lighting and wayfinding, among others.

In many locations, signage for motorized and nonmotorized users needs to be updated in order to conform with the Manual on Uniform Traffic Control Devices (MUTCD).

Many pedestrian facilities were observed to be non-compliant with Americans with Disabilities Act (ADA) regulations. While a full inventory of all ADA infrastructure was outside the scope of this study, some example problems have been identified in the recommendations. It is recommended that DART conduct complete accessibility reviews to identify and correct all such concerns within DART station properties.

Review of the Downtown Plano and CityLine Bush Stations was conducted while remaining cognizant of future connectivity to the DART Silver Line Commuter Rail (Cotton Belt) Project, currently in development.

2.2 Field Survey (Half-Mile Radii)

Inventories were developed of all proposed improvements within one-quarter mile of each station. Streets within one-quarter mile where existing sidewalks had been preliminarily identified as acceptable condition by NCTCOG were reviewed quickly by a combination of walking, biking, and/or driving. Within one-half mile of each station, the consultant team also reviewed corridors labeled as "Primary Routes" on NCTCOG's prior in-house mapping.

The primary focus of data collection efforts was information about major barriers to walking or biking to the stations. These included:

- Missing sidewalk links
- Unprotected crossings
- Multi-lane crossings
- Fences & landscaping
- Proximity to high-speed auto traffic

Map data from previous projects was reviewed revealing many locations where existing conditions had changed since NCTCOG's initial analysis. For example, recent sidewalk damage resulted in some additional gaps. Other gaps previously inventoried by NCTCOG had since been constructed by adjacent development or City/TxDOT projects.

2.3 Sidewalk Condition Classification

Existing sidewalk conditions were classified as acceptable or unaccaptable. As shown by the examples in Figure 3 on page 4, acceptable sidewalk was categorized as either "Excellent/Good" or "Fair." Unacceptable conditions included both "Poor" and "Nonexistent" sidewalk.

2.4 Incorporation of Other Data Sources

In some cases, additional improvements were constructed *after* the field work and were identified while conducting further review for prioritization on Google Maps aerial or Street View images. When such improvements were identified, the ArcGIS files were updated accordingly. However, other changes may have occurred between this review in Summer 2019 and the date of this report.

Information on several other sidewalk characteristics was compiled using Google Maps Street View in the office prior to the field visits and then verified by field personnel. For sidewalk segments, these characteristics included:

- Actual and effective sidewalk widths (accounting for obstructions such as utility poles)
- Type & width of buffer between sidewalk & street
- Presence & width of on-street parking, bike lanes & shoulder
- Presence of curb & gutter
- Posted speed limit
- Presence of lighting
- Number of adjacent travel lanes
- Adjacent land use category

The consultant team identified where sidewalk gaps are planned to be filled with shared use paths by reviewing NCTCOG's 2045 Regional Veloweb alignments adopted by the Regional Transportation Council. These were updated based on input from each city stakeholder about their most recent plans.

2.5 Identifying Crosswalks for Improvements

NCTCOG's prior in-house work identifying sidewalk gaps did not make any special considerations for crosswalks as distinct types of gaps in the pedestrian network. As part of this study, the consultants evaluated crosswalks at key locations, including:

- Existing signed and/or marked crosswalks crossing streets without signal or stop-sign control on the approaches being crossed.
- Unmarked/unsigned crossings of arterial or collector streets along radial lines to/from the station.
- Unmarked/unsigned crossings of arterial or collector streets not along radial lines to/from the station, but adjacent to significant pedestrian generators such as DART bus stops with significant levels of ridership, estimated by daily boarding and alighting data provided by DART.

Different types of field data were collected for signalized and unsignalized crosswalks during the field visits. At traffic signals, data collection included the number of lanes crossed in each direction, as well as the presence or absence of:

- Lighting
- Median refuge area
- Pedestrian ramps
- Countdown pedestrian signals
- Accessible pedestrian signals (APS)
- Pushbuttons (and if they were functional)

At unsignalized crosswalks, additional data collection items included:

- Whether the crosswalk had stop control for vehicular traffic or was uncontrolled.
- A two-minute count of traffic volumes crossing the crosswalk for locations where other daily traffic data from City or TxDOT sources was not available.
- Notes on any existing traffic control devices already present (such as signs, markings, or rectangular rapid flashing beacon (RRFB) assemblies.

Each input for both sidewalk segments and crosswalks were considered later for use in evaluating and prioritizing improvements, though some data were ultimately not utilized in order to simplify the prioritization process. Data collection forms (including handwritten notes taken on maps and pre-filled tables) are found in Appendix B.

2.6 Crosswalk Improvement Selection

At existing or proposed crosswalks without existing stop sign or signal control, potential improvements were evaluated based on guidance in the Federal Highway Administration's (FHWA) recent publication, "Guide for Improving Pedestrian Safety at Uncontrolled Crossing Locations" (July 2018). This publication includes enhanced guidance on countermeasures that can or should be considered for uncontrolled crosswalks with various combinations of vehicular speed, traffic flow, and number of lanes to be crossed. A selection table reproduced from this publication and additional details about how the consultant team used it to develop crosswalk improvement recommendations are found in Appendix C.

Improvement options evaluated by this methodology include high visibility crosswalk markings, parking restrictions on the crosswalk approach, upgrading lighting, pedestrian crossing warning signs, "Advance Yield Here for Pedestrian" signs, curb extensions, median pedestrian refuge islands, rectangular rapid-flashing beacons (RRFB's), road diets, and pedestrian hybrid beacons. Road diets were only recommended if roadways would likely still have excess capacity after the lane reductions.

A Microsoft Excel spreadsheet was created to automate the methodology and quickly produce a list of potentially recommended improvements given the inputs entered for each candidate crosswalk improvement location to be considered for the project. The analyst in each case still used engineering judgment to select which countermeasure options would ultimately be recommended. The inputs, options, recommendations, and notes are tabulated in tables found in Appendix D.

Figure 3: Sidewalk Condition Classification

Excellent/Good

- Functional for all users
- Meet all City & ADA standards (based on a superficial visual inspection only)

Fair

- May not be functional for some users, including those needing full ADA accessibility.
- Do not constitute gaps in the pedestrian network that would warrant replacement under funding programs designed to foster increased travel choices by walking and biking.
- May have moderate cracking & flaking with minimal uprooting or cracking.
- Minimal uplift by tree roots or other sources (estimated to be < 2" based on quick visual inspection)
- May warrant funding for accessibility upgrades under other programs designed specifically for that purpose or as part of cities' ADA Transition Plans
- Acceptable for the purposes of this project as being useful for a significant portion of the public who may be able to use them to travel to/from DART station.

Poor

- Poses potential hazards for all users.
- Severe cracking & flaking, with major uprooting & more significant trip hazards (vertical elevation differences > 2")
- Difficult to use by those pushing a wheelchair, cart, or stroller.
- Would require complete removal & replacement of at least one sidewalk panel.
- A few locations where steps had been consciously built into the sidewalk were also considered gaps.

Nonexistent

- Includes longer gaps of a City block or more
- Also some locations where individual panels were completely missing

- For vertical incongruities < 2", assumed that maintenance programs can make sidewalk passable to wheelchairs & strollers by providing asphalt wedges and/or grinding off corners < half depth of typical four-inch sidewalk slab.
- Since this project is targeting improvements that can be addressed by funding for new construction rather than maintenance funding, any trip hazards < 2" were assumed to be corrected by maintenance activities & therefore did not counts as gaps

2.7 Stakeholder Involvement

Coordination meetings were conducted with all technical stakeholders including staff from the cities of Dallas, Plano, Garland, and Richardson, as well as staff from DART and NCTCOG to review the recommendations, and for information specific to their jurisdiction and background knowledge of study locations, as needed. Meetings with the public were not held as part of this work.

2.8 Half-Mile Area Improvement Prioritization – Initial Trial Method

To provide opportunities for the greatest number of additional people to walk or bike to DART stations by constructing sidewalk, shared use path, crosswalk connections, and related infrastructure, the prioritization of identified improvements was structured to provide balance between estimating this objective accurately and applying the methodology to a large study area.

Initially, a prioritization approach that attempted to track as closely as possible to potential ridership increases was tested for the Parker Road Station in Plano, with adjustments for safety, key destination access, and equity. Though some of the elements of this initial prioritization methodology were ultimately not included in this study, they are documented in Appendix E as being potentially useful for later studies on a smaller scale. Also, many of the assumptions and methodologies explained in Appendix E were retained in the ultimate methodology.

2.9 Half-Mile Area Improvement Prioritization – Final Methodology

The prioritization process used to score potential projects placed significant emphasis upon distance to/from the station and the number of (density) of persons on parcels that could be connected by constructing new infrastructure—the potential new riders who could access the DART station. The study did not attempt to correlate how many people would actually use DART if the walking and bicycling routes to the rail station were improved.

Table 1 on page 6 identifies the criteria and weighting applied to rank potential projects. Additional details about the final methodology scoring process, including figures illustrating scoring for Plano's Parker Road Station, are provided in Appendix F. Highlights for each category and percent weight in the scoring system are as follows:

Figure 4: **Employment and Population "Tributary" to Sidewalk & Crosswalk Improvements**

Tributary Employment & Population (50%): Each sidewalk and crosswalk improvement was scored based on the total employment plus population that would be "tributary" to the station via the improvement once all proposed improvements are constructed.

Figure 4 illustrates the concept of tributary employment and population. It shows the parcels in the Parker Road Station area, with darker shades of gray representing higher population/employment totals. Note that, while some of the improvements shown in Figure 4 differ from the final recommendations, the principles illustrated still apply.

In the figure, each sidewalk and crosswalk improvement link is shown in different colors depending on the total employment plus population that would be "tributary" to the station via the improvement once all proposed improvements are constructed. The tributary employment plus population values are shown next to each link, with red links nearest the station having the highest values.

Distance (25%): Each improvement was scored based on distance to the station, measured linearly "as the crow flies" for simplicity. Improvements that connect directly to the station have a distance of 0.0 miles.

Trip Length Reduction (5%): Each improvement was evaluated based on the percentage reduction in walking distance to the station that would occur for the population of a representative reference parcel.

Access (5%): Land uses with a high proportion of visitors to employees and locations near bus routes received priority in the scoring for this criterion.

Crash History (5%): A GIS shapefile was used containing the point location of all reported bicycle and pedestrian crash locations for the study area from 2013 to 2017. While the scope of this project did not include pedestrian volume data collection, the crash data was observed to serve as somewhat of a surrogate for pedestrian demand. Therefore, a cluster of crashes may be more indicative of a place where many people walk than of a place that's more dangerous to walk in terms of the risk to individual pedestrians.

Systemic Safety (5%): A more recent development in transportation safety that is designed to combat the drawbacks of traditional crash analysis is the concept of "systemic safety" which refers to approaches that are data driven and network-wide. This approach considered improvements

Table 1: Weighting Criteria for Scoring Sidewalk and Crosswalk Improvements

Category	Tributary Employment & Population	Distance	Trip Length Reduction	Access		Safety		Equity
						Crash History	Systemic Safety	
Weight	**50%**	**25%**	**5%**	**5%**		**5%**	**5%**	**5%**
Inputs	Parcel population & jobs, GIS Network Analyst runs	Distance from Station	% Change in Pedestrian Trip Length	Other Nearby Destinations	Bus Routes	Number of nearby crashes in 5-year period	Posted Speed Limit	Environmental Justice Index
Description	Potential riders "upstream" of specific sidewalk or crosswalk improvements	Distance from individual improvements to station, measured "as the crow flies"	Measured for densest or farthest reference parcel tributary to each specific sidewalk or crosswalk improvement	Number of key destinations (hospitals, clinics, urgent care, schools, government buildings, courthouses, senior living, community centers, gardens, grocery stores, malls, supercenters, hotels, motels, entertainment, fine arts, parks, landmarks, athletic facilities, places of worship, libraries, museums, bus stops with > 25 daily boardings) within 250 feet of each improvement	Number of bus routes within 50 feet of each improvement that are also > 1/4 mile from station (Up to 3 points from bus routes but max. 5 points overall for key destinations and bus routes)	Number of crashes within 250 ft of improvement in 5-year period	Posted speed limit of parallel street or street being crossed	Designation of Above/Below Regional Average Percentage for Minority & Low-Income Populations
High Criteria/ Scoring Range	9,430 - 11,787 (20 to 25 points)	0 to 1/8 mile (25 to 19 points)	40-100% (5 points)	5+ destinations (5 points)	3+ routes (3 points)	5+ crashes (5 points)	≥ 45 mph (5 points)	Above Average for Both Minority and Low-Income (5 points)
Medium High Criteria/ Scoring Range	7,073 - 9,429 (15 to 20 points)	1/8 to 1/4 mile (18 to 13 points)	20-40% (3-4 points)	3-4 destinations (3-4 points)	2 routes (2 points)	3-4 crashes (3-4 points)	35-40 mph (3-4 points)	Above Average for Minority or Low-Income (3 points)
Medium Low Criteria/ Scoring Range	2,358 - 7,072 (5 to 15 points)	1/4 to 3/8 mile (12 to 6 points)	1-20% (1-2 points)	1-2 destinations (1-2 points)	1 route (1 point)	1-2 crashes (1-2 points)	25-30 mph (1-2 points)	
Low Criteria/ Scoring Range	0 - 2,357 (0 to 5 points)	3/8 to 1/2 mile (5 to 0 points)	0% (0 points)	No other destinations (0 points)	0 routes (0 points)	0 crashes (0 points)	≤ 20 mph (0 points)	Below Average for Minority and Low-Income (0 points)

at locations with similar characteristics to high crash locations, even if the locations where improvements are to be considered or proposed don't themselves have significant crash history.

As a measure of systemic safety, the project team opted to use the posted speed limit of the roadway adjacent to sidewalk improvements or crossed by crosswalk improvements. Vehicular speed is regarded as correlating well to safety outcomes in bicycle and pedestrian crashes.

Equity (5%): The equity criterion emphasized improving communities with populations that have not historically received equal access to resources. The consultants were provided spatial data for the project area with NCTCOG's Environmental Justice Index (EJI) to comply with federal rules for identifying Environmental Justice populations. The EJI is based on data from the 2013-2017 American Community Survey, aggregated at the census block level. Each census block is categorized if the percentage of its residents is higher than the regional average for minority population, low income, or both.

2.10 Gaps to Remain

The consulting team categorized some locations where gaps in the pedestrian network had been identified by NCTCOG during preliminary GIS work to be gaps to remain for the final project listing. This decision was based on field conditions that would be impractical or undesireable to implement or would make sidewalk construction extremely cost-prohibitive. Examples are detailed in Appendix F.

2.11 Improvement Numbering

Each proposed improvement, usually consisting of a single crosswalk or segment of sidewalk along a single city street block, was assigned a unique project-wide identification number for reference. The identification number consisted of:

- A two-digit code for the station area, matching the codes shown in Figure 2 earlier (For example, 1A for Parker Road, 1B for Downtown Plano, 1C for CityLine Bush).
- A two-letter abbreviation for the station name for easier reference (For example, PR for Parker Road, DP for Downtown Plano, CB for CityLine Bush).
- A two-letter code for the type of improvement (SW for sidewalk, CW for crosswalk, RP for repair, VW for Regional Veloweb, SP for shared use path, GP for gap to remain).
- A two- or three-digit number unique to identify the improvement location on project mapping. In addition to the VW improvement type code described in the bullet above, Regional Veloweb shared use path links have an improvement location number beginning with the letter V (V01, V02, etc.) to differentiate them from other improvements since they were numbered separately beginning at 1.

2.12 Prioritization Scoring

The consulting team evaluated each proposed improvement for the seven criteria described in Section 2.9 and Table 1. The proposed improvements were scored, and then sorted based the combined overall score. Possible total values ranged from 0-100 points. Additional details are included in Appendix F.

For each city (Dallas, Garland, Plano, and Richardson) separate scales were set for dividing improvements of varying scores into high, medium, and low-priority categories, but remained consistent for all stations within that city. The thresholds between high- and medium priority and medium- and low-priority were set such that approximately one-third of improvements for each city were allocated into each category. For half-mile areas surrounding DART rail stations in Plano, the scoring ranges were as follows:

- High Priority = 23 to 100 points
- Medium Priority = 17 to 22 points
- Low Priority = 0 to 16 points

The highest scoring improvement evaluated in Plano was 1A-PR-VW-V03, a segment of Regional Veloweb shared use path planned to extend from the station platform along the west side of the tracks south to Park Blvd. This improvement received a score of 54 points.

3. Improvement Recommendations

The following sections include project mapping and opinions of probable construction costs for existing and proposed conditions, and improvements that have been identified to improve pedestrian and bicyclist access to the stations.

3.1 DART Station Property Recommendations & Opinions of Probable Construction Cost (OPCC)

The first figure in each set that follows for individual station properties on pages 9, 14 and 15 illustrates the station area including DART property limits, existing sidewalks, Regional Veloweb shared use paths and local shared use paths in and around each station. Some proposed facilities on surrounding streets and connecting to station platform areas are drawn from the City of Plano's 2018 Bicycle Transportation Map, while other proposed facilities are new recommendations made herein based on this study.

The figure(s) on pages 10-12 and 15-17 show photographs of existing conditions at the same locations, referenced by matching, numbered orange stars. In many cases, the field photographs are enhanced with graphics to illustrate the proposed signing, pavement markings, or other traffic control devices that are recommended.

For each station, opinions of probable construction cost (OPCC's) were developed for each improvement, unless otherwise noted. The following cost components (totaling 25%) were applied to all costs, as directed and approved by both NCTCOG and DART:

- 10% design fee
- 4% mobilization
- 4% for landscaping allowance
- 2% for Erosion & Sediment Control Allowance
- 3% for traffic control
- 2% extra contingency for federal aid project

For additional details about the OPCC's, see Appendix G and Section 3.3 later in this report.

3.1.1 Parker Road Station (on DART Property)

Figure 1A-1.1 on page 9 shows the 18 improvements recommended for Parker Road Station within DART right-of-way. Figures 1A-1.2, 1A-1.3, and 1A-1.4 on pages 10-12 illustrate existing conditions at the 18 improvement locations.

A basic challenge for pedestrian and bicycle access to this station is the lack of direct connections to and from property to the east. The entire east boundary of the DART property is fenced and signed to prohibit pedestrian access. Despite this, the fencing near the station platform is low, allowing some pedestrians the ability to jump it to reach the platform after crossing the parking lot for the Plano Super Bowl bowling alley to the east.

A new Regional Veloweb shared use path had earlier been anticipated to connect to the east of the station on the north side of the Plano Super Bowl property, across K Ave at a pedestrian hybrid beacon, and along a creek greenway to the existing Santa Fe Trail, whose western terminus is about 2/3 mile east of the station platform. This alignment is indicated in the figures in Appendices E and F. This shared use path alignment would provide a significantly shorter walking or biking distance to the station for residents of the 1201 Park Apartments (with over 600 residents) on the east side of Dobie Dr, as well as single-family neighborhoods farther east.

However, City of Plano staff indicated that the right-of-way easements for this shared use path had proven too difficult to obtain, and so it had been removed from the City's 2018 update to the Bicycle Transportation Plan. Consequently, the path was removed and substituted with a new local shared use path (#15 in Figures 1A-1.1 and 1A-1.3 on pages 9 and 11, respectively) extending east from the south end of the station platform through property owned by the City of Plano. More information on the portion of this improvement extending farther away from the station is shown in Figure 1A-2, in Section 3.2 on page 19.

The shared use path connection to the station platform south of the Plano Super Bowl would be complemented by a taller, anti-climb fence along the remainder of the station's eastern boundary to discourage crossing of the northbound tracks at unauthorized locations (shown as #18 in Figures 1A-1.1, 1A-1.3, and 1A-1.4 on pages 9, 11 and 12). An example of this type of fencing, built recently along Lancaster Ave in Fort Worth, is shown in Figure 1A-1.4 on page 12.

Other more direct connections to areas northeast and southeast of the station would be provided by constructing the north-south Regional Veloweb shared use path on the west side of the station platform, parallel to the tracks, shown as improvements #3 and #14 in the mapping and existing conditions figures on pages 9-11. More information on the portion of this improvement extending farther away from the station is shown in Figure 1B-2 referenced in Section 3.2 on page 20.

Other recommended improvements include:

- Adding pedestrian lighting for the sidewalk in the wooded area northwest of the bus loop
- Improving the crosswalks crossing Archerwood St
- Adding and improving existing bicycle parking
- Moving ADA parking closer to the accessible sidewalk routes to the station platform
- Modifying landscaping to better channelize pedestrian movements and provide clear, full sidewalk width for pedestrians.
- Making signing and pavement markings consistent with the Manual on Uniform Traffic Control Devices (MUTCD) for compliance and for improved motorist, pedestrian, and bicyclist understanding of multi-modal conflict areas.

Refer to the figures for additional details.

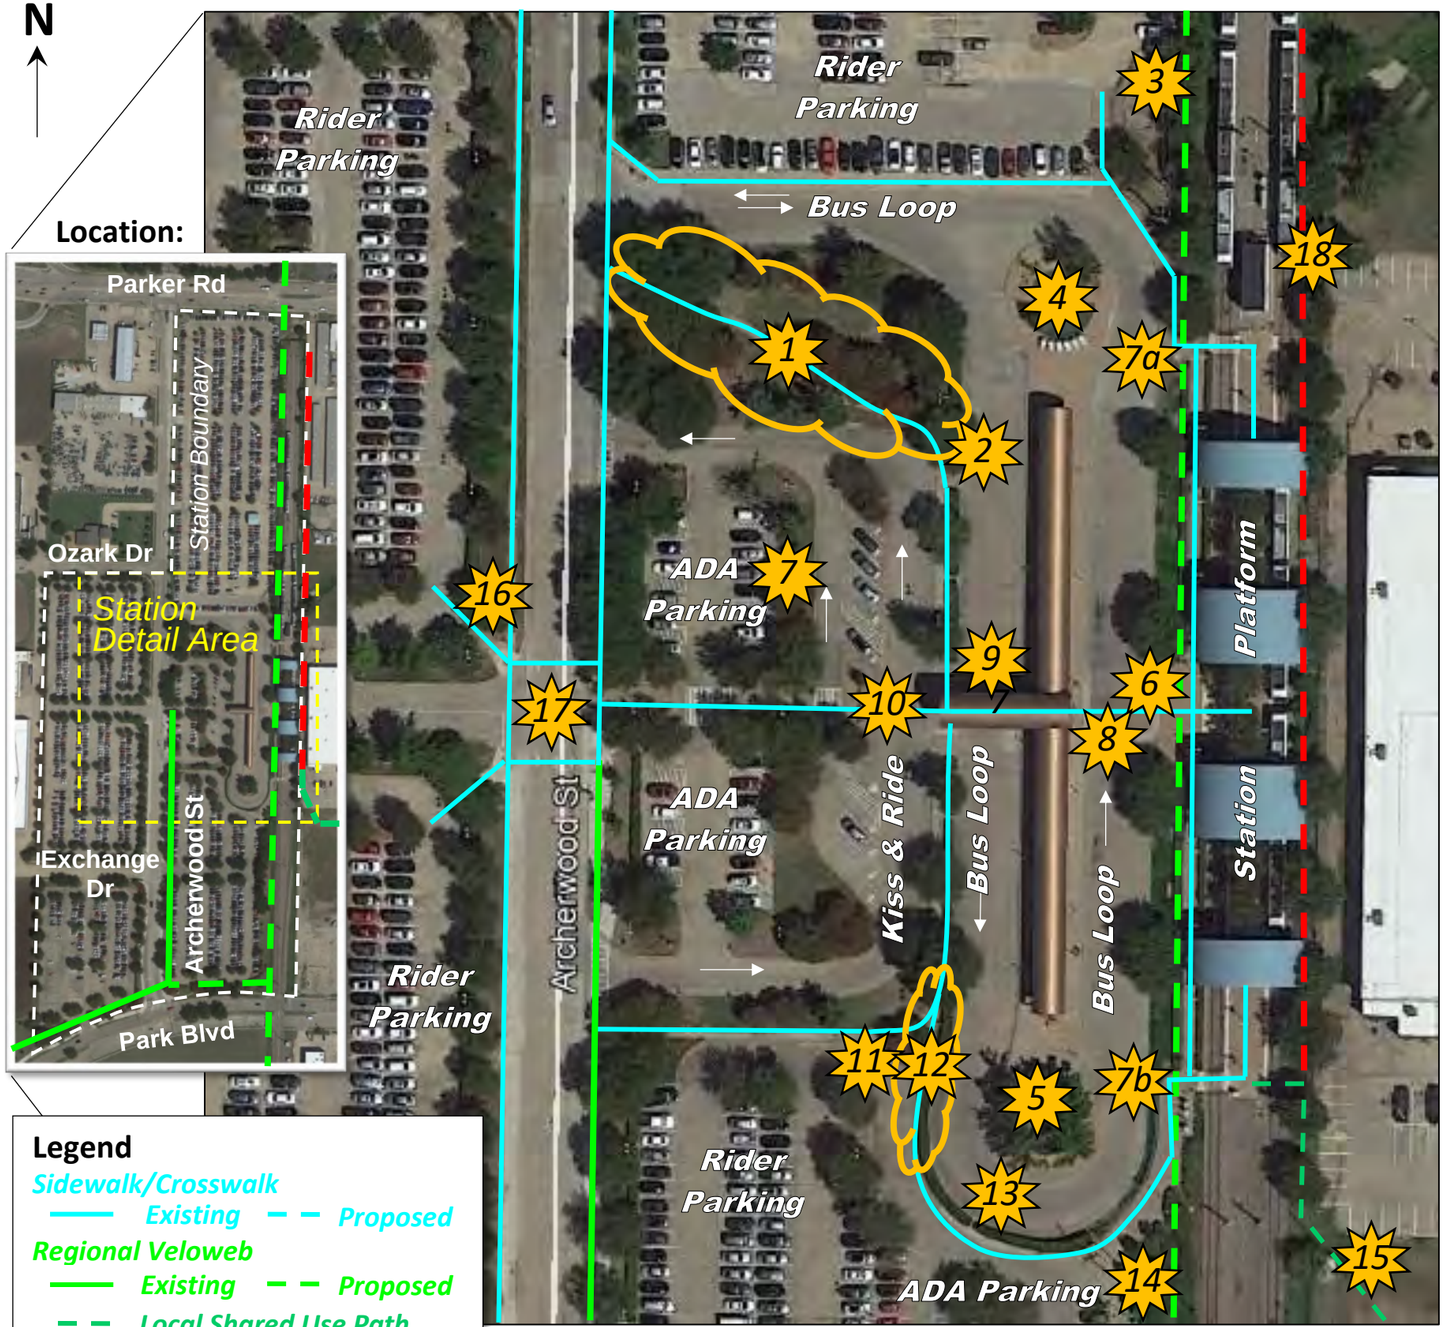
The total OPCC for the improvements on the Parker Road Station DART property is approximately $362,000. This excludes the cost of the Regional Veloweb and local shared use paths crossing DART property (1A-PR-ST-03 and 1A-PR-ST-14 and 1A-PR-ST-15), which are assumed to be separate projects itemized later under Section 3.2.1. Matrix tables listing the estimated costs for individual improvements, as well as line item calculations, are included in Appendix H.

Parker Road Station Recommended Access Improvements

Total for All Recommendations at Station: **$361,650**

North Central Texas Council of Governments

DART Red & Blue Line Corridors Last Mile Connections



Number	Description
1	Add pedestrian lighting for area where tree cover makes for dark nighttime conditions.
2	Close gap in hedges that appears to imply this as a valid location for crossing the bus loop. Consider fencing to redirect pedestrians. The lack of ramps or a crosswalk across the bus loop here makes this an inappropriate location for a crossing. A fire hydrant here is likely the reason for the gap in the hedges, so fire hydrant access from the bus loop should be preserved.
3	Add Regional Veloweb shared use path to connect platform more directly to Parker Road to the north. Will require grading, new fence between parking lot and tracks, and drainage modifications. Concrete drainage swales drain parking lot downhill toward the east at several locations across proposed path alignment, so additional study will be required.
4-5	Add educational signing at all covered bike parking locations regarding rules of use. Existing covered bike parking lids were locked. Several of the locked lids were empty without bikes inside or were storing personal belongings. The locking of empty lids indicates a shortage of available covered bike parking.
6	Add additional covered bike parking, preferably closer to train platform (at Location 4).
7	Relocate ADA parking from Location 7 closer to the north crosswalk to the train platform (near Location 3). Reasons for this change are: • Ramps are absent for crossing the southbound tracks east of the bus loop (near Location 6). • Much of the ADA parking for the station is in the small parking lot immediately west of the bus loop (Location 7 and southwest of Location 10). Some ADA parking is already located southwest of the platform near Location 14. • The lack of ramps near Location 6 requires passengers in wheelchairs to travel to the compliant crosswalks at the north or south ends of the platform (Locations 7a or 7b) rather than the more direct route via the central crosswalk.
8-9	Add 12” white markings on each side of brick paver crosswalks. Bus loop crosswalks are stop-controlled, but need white markings outside the brick area to be legal crosswalks.
10	Add pedestrian warning signs and 12” white markings outside brick pavers for Kiss & Ride crosswalk. (Crosswalk is raised to slow drivers but not signed or marked.)
11	Correct trip hazard on sidewalk.
12	Trim hedges or replace with easier maintenance plants so they don’t encroach on sidewalk.
13	Close hedge gap that provides access to existing covered bike parking (at Location 5), Gap in hedges is convenient for bicycle access to existing covered parking, but lacks ramps and conflicts with bus loop. Provide bike parking closer to platform as indicated at Location 4 above.
14	Add new shared use path connecting platform more directly to Park Blvd to the south on planned Regional Veloweb alignment. May require relocation of utilities or removal of trees and/or parking spaces.
15	Add connection via City-owned property south of platform. Additional study will be required.
16	Trim tree blocking flashing light for crosswalk.
17	Improve the visibility of the two crosswalks across Archerwood Street: • Add pushbuttons at each ramp so the flashing warning lights on Archerwood St don’t need to operate only on a time-of-day peak hour schedule. (They were observed inactive during off-peak hours). • Add advance yield lines and “Yield Here to Pedestrians” signing. • Consider converting to Rapid Rectangular Flashing Beacon (RRFB).
18	Add taller anti-climb fence along east DART property line from north end of tail track to southeast corner of platform to channelize pedestrian crossings to new connection via Plano City property to the southeast.

Not for Construction

3.1.2 Downtown Plano Station (on DART Property)

Figure 1B-1.1 on page 14 identifies two recommended improvements as well as existing conditions at the Downtown Plano Station. This station has a small geographic footprint without a DART-controller Park & Ride lot, so the number of on-site improvement opportunities are limited.

The two recommended improvements include additional bike parking and improving the crosswalk across 15th St immediately south of the station. The City of Plano notes that this second improvement is already planned under upcoming CIP project 6993. The total OPCC for the improvements for Downtown Plano Station on DART property is approximately $12,400, for the bicycle parking (1B-DP-ST-02).

The OPCC excludes any widening of the existing sidewalk (already about 8' wide or more in most places) on the west side of the DART tracks to convert it into a future shared use path on the Regional Veloweb system, since this widening would not be necessary for basic pedestrian access and could therefore occur later than other improvements as a separate project without having a significant impact on multi-modal access to the station. The City and DART could implement a separate dedicated bicycle facility (such as through Haggard Park) rather than widening the existing sidewalk, which could be retained for pedestrian only accommodations, The existing parking lot west of the station could also be reconfigured to accommodate a shared use path or dedicated bikeway.

Tables listing the estimated costs for individual improvements, as well as line item calculations, are included in Appendix H.

3.1.3 CityLine Bush Station (on DART Property)

Figure 1C-1.1 on page 15 identifies ten improvements recommended at CityLine Bush Station on DART property. Note that only those improvements located north of the President George Bush Tpk (PGBT) centerline are located in the City of Plano, with the station platform itself and all other improvements in Richardson. Figures 1C-1.2 and 1C-1.3 on pages 16-17 illustrate existing conditions at the ten improvement locations. Several of the improvements discussed are at the boundary of DART's right-of-way and would therefore require coordination between DART, TxDOT, NTTA and/or the Cities of Plano and Richardson. (TxDOT maintains the PGBT frontage roads as SH 190). These improvements are also discussed in Section 3.2 and the accompanying Figure 1C-2 on page 22) detailing off-station improvements.

The recommended improvements include:

- Constructing enhanced crosswalks for crossing the PGBT westbound frontage road at Crawford Rd/Topridge Dr and just east of the DART track crossing. See items 7 and 10 in Figure 1C-1.1. Enhanced conspicuity for crossing pedestrians and bicyclists is needed due to the high speeds permitted on the frontage roads and the large apartment complexes recently constructed on the north side of the PGBT. The crossing east of the DART tracks is being constructed as part of the Cotton Belt Trail construction.
- Providing short, more direct sidewalk paths connecting to adjacent private property to follow observed worn paths in the grass indicating existing pedestrian demand. See items 3 and 6 in Figure 1C-1.1. Coordination with adjacent property owners would be required.
- Adding and improving ADA ramps for better wheelchair access on the station platform.
- Adding pedestrian warning signs at crosswalks to the station platform.

Refer to the figures for additional details.

DART's Silver Line project will provide future commuter rail service beginning in late 2022 between DFW Airport and the new Shiloh Road Station east of the CityLine Bush Station. Many of the sidewalk connections in and around the existing CityLine Bush Station platform, including the last two items in the bulleted list above, will be reconstructed in the near future as part of the Silver Line project.

The total OPCC for the DART improvements in Plano is approximately $70,000. This excludes costs for improvements 1C-CB-ST-01 through 1C-CB-ST-06, which are located in the City of Richardson, some assumed to be mostly on private property. The $70,000 total includes a portion of costs for improvements 1C-CB-ST-07 through 1C-CB-ST-10, which were also integral to the half-mile area analysis undertaken in Section 3.2 and are therfore quantified more completedly together with off-site improvements as shared costs between DART, the City of Plano, and the City of Richardson. Tables listing the estimated costs for individaul improvements, as well as line item calculations, are included in Appendix H.

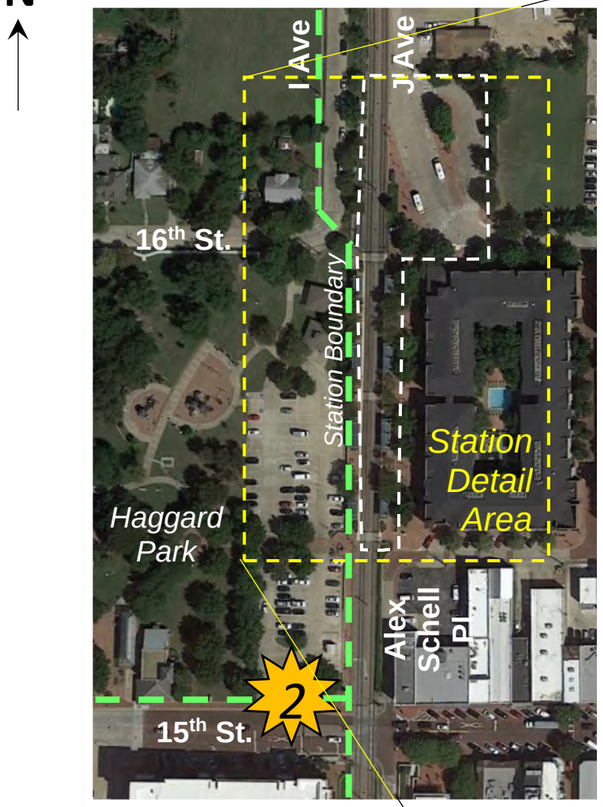
Downtown Plano Station Recommended Access Improvements

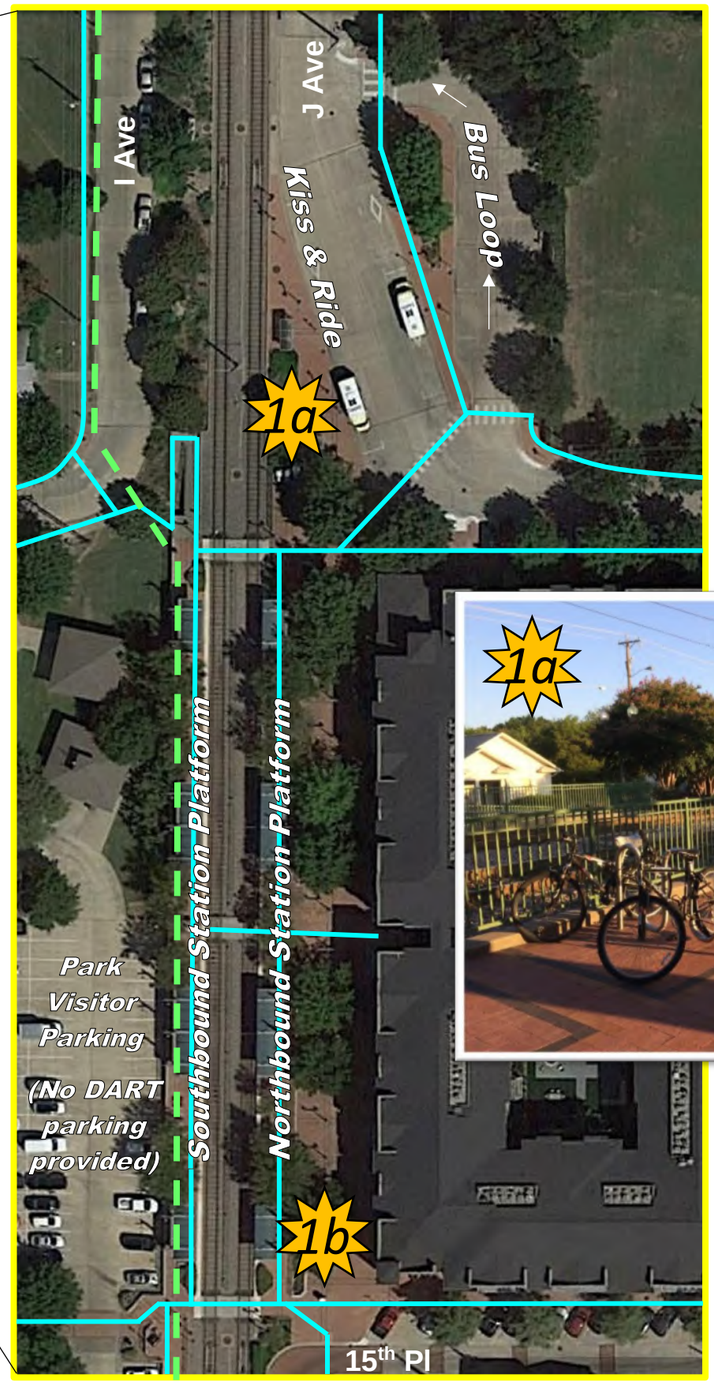
Total for All Recommendations at Station: **$12,350**

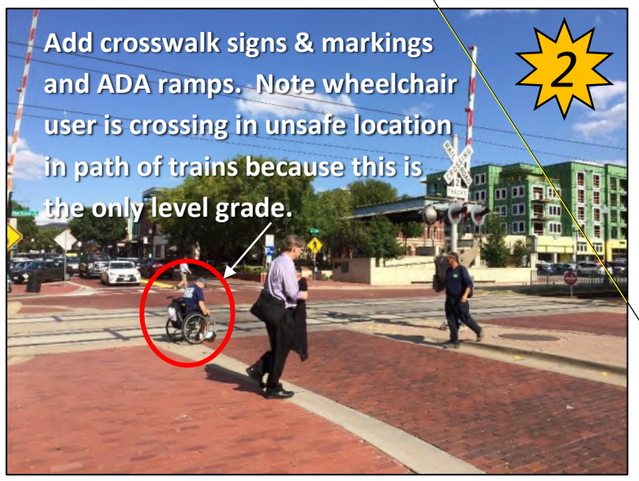
North Central Texas Council of Governments

DART Red & Blue Line Corridors Last Mile Connections

Location:







Number	Description
1	Increase supply of covered bike parking. Three covered bike spaces at Location 1a north of the platform were observed locked but empty at 7 am, indicating unmet demand. Locate new bike parking near south end of platform (near Location 1b) for improved access for cyclists traveling to and from the south. At both locations, add signing to discourage improper use of covered bike parking.
2	Build multi-use trail on proposed Regional Veloweb alignment west of DART tracks and on north side of 15th Street west of tracks. Where the future trail alignment crosses 15th Street, existing pedestrian demand already exists, as shown in the photo for Location 2. Crosswalk signs & markings, a median cut-through island, and ADA ramps are needed here. Pedestrians, including one wheelchair user, were observed crossing 15th Street between the tracks and the railroad crossing gates due to the lack of an accessible path.

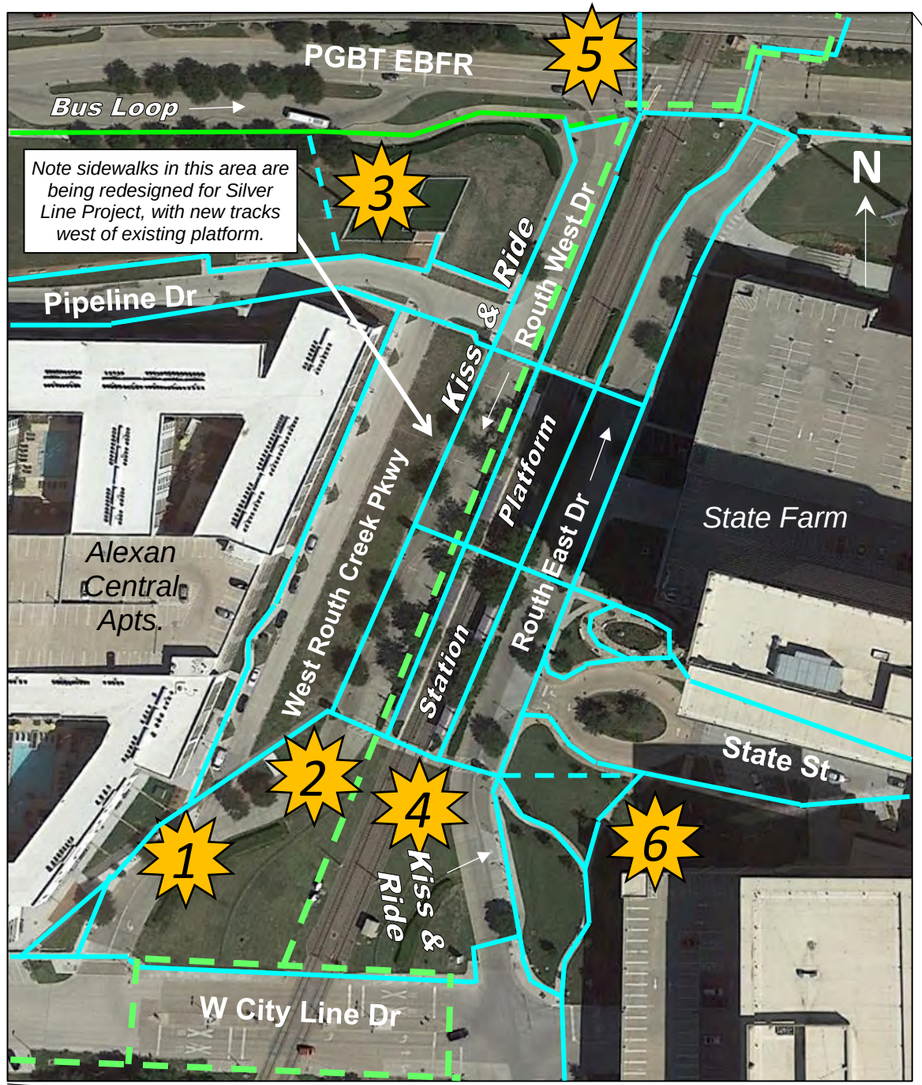
North Central Texas Council of Governments

DART Red & Blue Line Corridors Last Mile Connections

Number	Description
1	The Dallas tourism "BiG" sign on Routh West Dr just south of the station should be reversed to face the opposite direction or the sign should be relocated to a safer position. The sign faces the street, a poor orientation since those taking photographs of others posing at the sign will be tempted to stand in the travel lanes.
2	Widen the ADA ramp to Routh West Dr from the south end of the platform to allow wheelchair users to bypass the large vine sculpture blocking the top of the ramp.
3	Coordinate with adjacent property owner to add a direct sidewalk connection between train platform & bus loop. A worn path in the grass ("goat trail") exists between the southwest corner of the Alexan Central Apartments dog park on Pipeline Dr and the DART bus stops along the PGBT eastbound frontage road. This is the most direct route between the train station platform and the bus stops, shorter than walking north along Routh West Dr and the frontage road. See improvement 1C-CB-SW-071.
4	Add pedestrian warning signs on the right-hand side of the roadway at the six crosswalks to the station platform across Routh East Dr and Routh West Dr. Existing signs are mounted on the left-hand side only. Add missing ADA ramps at two of the same locations.
5	Repair the sidewalk panel where settlement has created a trip hazard near the pedestrian pushbutton on the north side of the President George Bush Turnpike (PGBT) eastbound frontage road at Routh West Dr.



NOT TO SCALE

Legend

Sidewalk/Crosswalk
- *Existing*
- *Proposed*

Regional Veloweb
- *Existing*
- *Proposed*

Number	Description
6	Coordinate with the adjacent property owner to construct a short segment of sidewalk for more direct travel between the southern crosswalk to the train platform and the south sidewalk along State St. A "goat trail" cuts the corner where the existing sidewalk is offset from the crosswalk, indicating existing pedestrian demand.

Number	Description
7	Construct a new, short segment of sidewalk on the west side of the Crawford Rd/Topridge Dr crossing under the PGBT, near the north end of the underpass adjacent to the PGBT westbound frontage road (WBFR). Add marked, signed crosswalks across both legs of the WBFR. The existing sidewalk on the west side extends north from the EBFR but ends just south of the WBFR. Provide pedestrian hybrid beacon with advance "Yield Here to Pedestrians" signing for crossing PGBT westbound frontage road. See also half-mile area improvements 1C-CB-CW-042 and 1C-CB-CW-043 for more information.
8	Add sidewalk on east side of Crawford Rd/Topridge Rd between PGBT frontage roads. See also improvement 1C-CB-CW-056 in the half-mile improvements map & matrix.
9	Add a crosswalk across the east leg of the PGBT Eastbound Frontage Road (EBFR) at Topridge Dr. Provide pedestrian hybrid beacon with advance "Yield Here to Pedestrians" signing. See also half-mile area improvement 1C-CB-CW-059.
10	Construct a crosswalk across the PGBT WBFR just east of the track crossing. Also, consider adding a traffic signal here similar to the existing signal on the PGBT EBFR, with care taken to coordinate with the adjacent railroad crossing gates. A crosswalk west of the tracks that will be removed with the Silver Line construction currently has only pedestrian warning signs and ramps. These changes will provide safer access to the DART station for residents of apartments on the north side of the westbound frontage road. See half-mile area improvement 1C-CB-CW-045 for more information.
General	Many pedestrian ramps in the station area are missing detectable warning surfaces, which should be added.

3.2 Half-Mile Area Recommendations

Figure 1A-2, Figure 1B-2, and Figure 1C-2 on pages 19, 20 and 22 identify recommended high-, medium- and low-priority improvements as separate construction packages for each station's half-mile area in Plano. These figures are collectively referred to as phasing maps. High-priority improvements should be considered for Phase 1 of construction at each station. As funding is available the medium and low-priority improvements should be implemented either with the Phase 1 improvements or as part of future phases.

The legend for each map includes a brief summary of opinions of probable construction cost for each phase and station, which are described in greater detail in Section 3.3.

For additional context, Appendix I contains detailed maps of the recommendations for each station's half-mile area, including existing, planned, and funded regional and local shared use paths, as well as existing, planned and funded on-street bicycle networks.

In each phasing map, existing sidewalks are shown in light blue. The density of individual parcels' population plus employment are shown in grayscale, with darker colors representing higher values.

Proposed sidewalk and crosswalk improvements are shown in multiple colors, according to the assigned priority: red for high-priority (Phase 1), orange for medium-priority (Phase 2), and light pink for low-priority (Phase 3). Gaps to remain are shown in dark pink. For more details about these categories, refer to Appendix F.

Each high- medium- and low-priority improvement, along with all gaps to remain, are indicated by the boxed number labels near each improvement location. The lower right corner of each phasing map includes a legend that describes the abbreviations in the improvement ID codes, which can be used to cross-reference the improvement matrices that appear in Appendix J.

For solid red, orange, or light pink lines, the recommended improvement for a sidewalk gap is either a new or repaired 5-foot wide sidewalk or a new 10-foot shared use path along the length shown. Repairs are noted in the matrix notes for each improvement in Appendix J, and assume full removal of damaged, existing sidewalk prior to replacement.

For crosswalk gaps, the type of improvement recommended is shown with numbered circles located near each crosswalk. The numbers in the circles correspond to the legend of possible pedestrian safety countermeasures appearing at the upper right of the figure. More details about these improvements can be found in Section 2.6, as well as in Appendix C, Appendix D, and Appendix J. Treatments recommended somewhere on the phasing maps have a red box around them in the legend for easier reference.

The "Half Mile Area Improvements Matrices" appearing in Appendix J for each station list for each improvement the owner, improvement type, location, length, notes, priority score, and (in the case of high priority improvements not built by others) the opinion of probable construction cost. Additional information useful for interpreting the tables in Appendix J may be found in Appendix I.

3.2.1 Parker Road Station (Half-Mile Area)

Figure 1A-2 shows the recommended improvements in the half-mile area around the Parker Road Station. Central Expy (U.S. 75), Parker Rd, Park Blvd, and K Ave are all arterials that provide barriers to multi-modal travel to and from the station. Due to a lack of collector streets east of the station, multi-modal travel to and from that direction is significantly more circuitous, though planned shared use paths will improve the situation.

Note that a portion of the half-mile radius for Parker Road Station to the south overlaps with the northern half-mile radius for the Downtown Plano Station. Improvements for the overlapping area were considered together with the Downtown Plano Station area, as discussed in the following section.

As noted in Section 3.1.1, a challenge for pedestrian and bicycle access to this station is the lack of direct connections to and from property to the east. Pedestrians are routinely observed jumping the low fence to reach the station platform from the bowling alley parking lot to the east.

A new local shared use path (1A-PR-VW-V5 in Figure 1A-2.1) is proposed extending east from the south end of the station platform along the north side of property owned by the City of Plano. At its intersection with K Ave, a pedestrian hybrid beacon (1A-PR-CW-26) would facilitate crossing six lanes of high-speed traffic. While a dedicated sidewalk alignment would not continue farther east for direct access to the apartments east of Dobie Dr due to existing businesses between K Ave and Dobie Dr here, many apartment residents would still likely be able to traverse the business parking areas on foot.

Other more direct connections to areas northeast and southeast of the station would also be provided by constructing the north-south Regional Veloweb shared use path on the west side of the station platform, parallel to the tracks, shown as improvements 1A-PR-VW-V2 and 1A-PR-VW-V3 in Figure 1A-2.2.

A pedestrian hybrid beacon would serve multi-modal users crossing Parker Rd to the north of the station, while a traffic signal would accomplish the same purpose for crossing Park Blvd to the south. The pedestrian hybrid beacon (PHB, also known as a HAWK beacon) has the advantage of stopping traffic only for the duration necessary for pedestrians to clear a driver's travel lane, rather than requiring a stop for the whole duration of the walk and flashing don't walk intervals.

Additional details about other improvements recommended in Figure 1A-2, as well as challenges associated with the recommended gaps to remain, are included in the expanded narrative and matrix notes for Parker Road Station that can be found in Appendix I and Appendix J.

3.2.2 Downtown Plano Station (Half-Mile Area)

Figure 1B-2 identifies the recommended improvements in the half-mile area around the Downtown Plano Station. Downtown Plano is pedestrian friendly, with on-street parking and lower speeds along 15th St south of the station promoting a friendlier crossing environment. However, some improvements can be made along 15th St, including new or improved crosswalks. The one-way couplet of K Ave and Municipal Ave also carries a higher speed and volume of traffic that presents somewhat of a barrier to the safety and level of comfort of pedestrian travel, as does 14th St two blocks south of the station, where transit-oriented development is occurring, with more expected in the future.

01 ← Improvement Number (Matches [1] on Map)

Recommended improvements include new or improved crosswalks across 15th St at I Ave, at the proposed Regional Veloweb shared use path parallel to the DART tracks, and mid-block between J Ave and K Ave. Similarly, crossings across K Ave at 16th St, 15th Place and south of 15th St can provide improved safety.

A common need at many of these locations is advance "Yield Here to Pedestrians" signing and yield line striping (Item #3 in the "Possible Pedestrian Safety Countermeasures" legend).

City of Plano CIP project 6993 will construct improvement 1B-DP-CW-59 immediately south of the station where pedestrian ramps and a median cut-through are missing for a significant demand of bike and pedestrian travel between the station and apartments immediately to the southwest.

Proposed improvements 1B-DP-SW-62, 1B-DP-SW-63, 1B-DP-CW-63, and 1B-DP-RP-64, which cross the Plano Municipal Center and K Ave to the east, would connect apartment complexes and single-family residential neighborhoods to the northeast more visibly and directly to the station.

Crosswalks across 14th St at I Ave, at the future Regional Veloweb alignment described in the previous paragraph, and/or at J Ave are also recommended for better multi-modal access. A PHB is recommended at I Ave (#93 and #94), while a pedestrian traffic signal is recommended at the Veloweb crossing in close proximity to J Ave (1B-DP-CW-95 and 1B-DP-CW-96).

In the southern part of the study area, the existing rail tracks parallel to 12th St will be the location of the future 12th Street Station on DART's Silver Line Commuter Rail Project. Many of the sidewalk and shared use path connections in and around the future 12th Street Station platform will be built or reconstructed in the near future as part of the Silver Line project.

Additional details about other improvements recommended in Figure 1B-2, as well as challenges associated with the recommended gaps to remain, are included in the expanded narrative and matrix notes for Downtown Plano Station that can be found in Appendix I and Appendix J.

3.2.3 CityLine Bush Station (Half-Mile Area)

Figure 1C-2 on page 22 identifies the recommended improvements in the half-mile area around the CityLine Bush Station. Central Expy (U.S. 75), the President George Bush Tpk (SH 190) and K Ave/N Plano Rd all pose boundaries to multi-modal access to the station. While the station is located just south of the Richardson City line formed by the PGBT, new transit-oriented residential development has occurred north of the PGBT in Plano, with other undeveloped parcels expected to bring more such development. The current configuration of the Park & Ride lots located below the PGBT bridge structures is oriented primarily to serve DART riders driving to the station, with fewer accomodations for pedestrian and bicycle trips through the large parking lots.

Several sidewalks and connecting crosswalks should be built through and around the Park & Ride lots below the PGBT bridges. The high posted speed limits along the PGBT frontage roads create the need for high-visibility crosswalks. Therefore, pedestrian hybrid beacons are recommended at the Crawford Rd/Topridge Dr crossings of the PGBT frontage roads (1C-CB-CW-42, 1C-CB-CW-43, and 1C-CB-CW-59). Also, a pedestrian traffic signal is recommended for the crossing of the PGBT westbound frontage road just east of the DART tracks (1C-CB-CW-45). The existing crosswalk across the WBFR west of the tracks will be removed as part of the Silver Line Construction, which is still under design but will reconfigure other existing sidewalks and crosswalks in and around the station.

Three existing signalized intersections should receive pedestrian access improvements. Marked crosswalks and countdown, accessible pedestrian signals should be added at the intersections of Plano Pkwy with F Ave/Executive Dr and with K Ave. Though pedestrian indications are already present at the K Ave/N Plano Rd intersection with the PGBT frontage roads, sidewalks (1C-CB-SW-046, 1C-CB-SW-047, and 1C-CB-SW-061) need to be added so that pedestrian travel through these intersections can occur during all weather and for DART riders of different abilities.

Additional details about other improvements recommended in Figure 1C-2, as well as challenges associated with the recommended gaps to remain, are included in the expanded narrative and matrix notes for CityLine Bush Station that can be found in Appendix I and Appendix J.

3.3 Half-Mile Area Opinions of Probable Construction Cost

In addition to the Opinions of Probable Construction Cost (OPCC's) developed for the on-site improvements at DART Stations in Section 3.1, OPCC's were developed for nearly 1,100 separate high-priority improvements totalling nearly 58 linear miles in the half-mile areas surrounding each of the 28 DART stations within the study area.

OPCC's were developed in the half-mile areas for each high-priority improvement that was ***not*** assumed by City staff to be built by others (as part of another project by a developer, the City, TxDOT, etc.) in the near future. Aggregate OPCC's were developed for low- and medium-priority improvements by extrapolating average costs from the high-priority improvements.

Appendix G details the assumptions that were made in order to provide high-quality, yet preliminary OPCC's. Detailed unit price and quantity estimates for the individual high-priority Phase 1 half-mile area improvements are listed in Appendix K which supplement the OPCC's for the proposed DART property improvements in Plano provided in Appendix H. A summary of how overall cost estimates for low- and medium-priority Phase 2 and Phase 3 improvements were derived is also included in Appendix K.

The estimated cost of all projects in Plano is summarized in Table 2. The cost of improvements located within Richardson around the CityLine Bush Station is excluded from the totals listed in Plano. For convenience, grand total costs are provided in both 2020 dollars and 2025 dollars, assuming for 2025 a 4% annual escalation rate for all three phases. Costs presented in all other figures, tables, and appendices of this report reflect 2020 dollars only.

Table 2: Summary Opinion of Probable Construction Cost for Improvements in Plano

Station No.	Station Area	DART Station Property	Half-Mile Area				
			High Priority (Phase 1)	Medium Priority (Phase 2)	Low Priority (Phase 3)	*Grand Totals (2020)*	*Grand Totals (2025)*
1A	Parker Road	$361,650	$2,305,200	$730,000	$258,000	*$3,654,850*	*$4,446,700*
1B	Downtown Plano	$12,350	$1,927,100	$2,595,500	$2,011,300	*$6,546,250*	*$7,964,600*
1C	CityLine Bush	$69,600	$1,421,700	$1,219,400	$683,500	*$3,394,200*	*$4,129,600*
City of Plano Totals		*$443,600*	*$5,654,000*	*$4,544,900*	*$2,952,800*	*$13,595,300*	*$16,540,900*

As shown in Table 2, the 2020 total estimate for all improvements in Plano is about $13.6 million. High-priority Phase 1 multi-modal access improvements within the half-mile station areas inside Plano City limits are estimated to cost about $5.7 million. Of this total, about $444,000 would be the responsibility of DART on its station properties, including a portion of improvements near the station boundaries, where financial responsibility is assumed to be shared between DART and the City. Near the CityLine Bush Station, improvements crossing the Plano/Richardson City line were assumed to have shared financial responsibility between the two cities, TxDOT and DART.

Medium- and low- priority costs for Phases 2 and 3 were estimated by developing more generalized unit costs for five types of improvements, based on all high-priority improvements City-wide. Tables 3-5 on page 24 illustrate this procedure.

The first row in each table lists the total linear feet of high-priority sidewalk, sidewalk repair, and Veloweb/shared use path construction City-wide, along with the respective cost totals. It also lists the overall count and cost of crosswalks, classified as simple crosswalks (implemented with signs and markings ony) or other crosswalks (which include beacons, islands, or signals). The bottom two rows of each table show how the same unit rates per linear foot or per each crosswalk were used to extrapolate overall cost estimates for the medium- and low-priority improvements without estimating costs for individual locations in those categories.

For reference, the unit price of 5 ft-wide sidewalk alone was assumed at $35 per linear foot. The all-inclusive price per linear foot of sidewalk improvements (including items such as pedestrian ramps, utility relocation, retaining walls, driveway reconstruction, contingencies, etc.) was calculated for each of the high-priority improvements, ranging between a low of about $44/LF to a high of about $690/LF. Lower unit costs were associated with simple sidewalk improvements without obstacles, while higher unit costs were associated with higher densities of challenging conditions, especially along short segments.

Table 3: Opinion of Probable Construction Cost for Parker Road Station Half-Mile Area

Phase/ Priority	Sidewalks			Sidewalk Repairs			Veloweb/ Shared Use Paths			Simple Crosswalks			Other Crosswalks (with Beacon, Island or Signal)			
	Lin. Ft	Cost	~$/LF	Lin. Ft	Cost	~$/LF	Lin. Ft	Cost	~$/LF	#	Cost	~$/EA	#	Cost	~$/EA	Total Cost
High Priority (All Plano)	21,190	$ 3,215,000	$ 152	47	$ 11,600	$ 247	3,895	$ 946,400	$ 243	6	$ 51,800	$ 8,634	16	$ 1,573,600	$ 98,350	***
Phase 1/ High*	4,405	$ 531,000	-	12	$ 900	-	3,895	$ 946,400	-	2	$ 15,800	-	6	$ 811,100	-	$ 2,305,200
Phase 2/ Medium**	2,320	$ 352,700	$ 152	15	$ 3,800	$ 247	1,430	$ 347,500	$ 243	3	$ 26,000	$ 8,634	-	-	$ 98,350	$ 730,000
Phase 3/ Low**	1,640	$ 249,300	$ 152	-	-	$ 247	-	-	$ 243	1	$8,700	$ 8,634	-	-	$ 98,350	$ 258,000
	8,365	$ 1,133,000		27	$ 4,700		5,325	$ 1,293,900		6	$50,500		6	$ 811,100		$ 3,293,200

** High priority cost opinions are based on field visits and bid item breakdowns, but without the benefit of survey, subsurface utility investigation, or other engineering information typically available for semi-final design.*

*** Medium- and low-priority cost opinions are not based on individual improvements, but instead extrapolated from cost/linear foot calculations for high-priority improvements; actual costs may vary significantly, especially for crosswalk improvements.*

**** Costs for all Plano include costs attributed to DART and others in calculating average costs per unit length or crosswalk, and therefore do not match the total value shown in Table 2.*

Table 4: Opinion of Probable Construction Cost for Downtown Plano Station Half-Mile Area

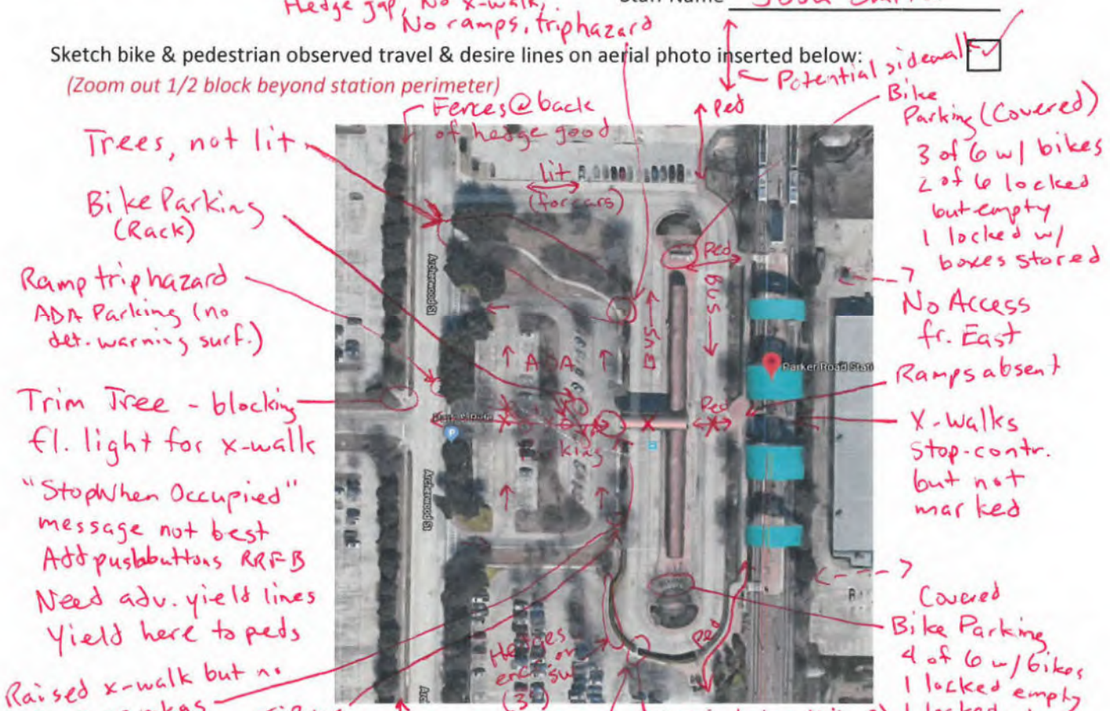
Field Data Checklist - Stations

Date 7/25/18
Station Parker Rd
Staff Name Josh Smith

Hedge gap, No x-walk, No ramps, trip hazard

Sketch bike & pedestrian observed travel & desire lines on aerial photo inserted below:
(Zoom out 1/2 block beyond station perimeter)



Are any desire lines missing a marked crossing location on a perimeter street, especially if mid-block? *(If Yes, note on sketch and add line with "New" link ID on Crossings Checklist)* — Y N

Note bike parking locations (covered vs. rack vs. bikeshare) — ✓
Do any travel routes differ significantly from linear desire lines? To/from east — (Y) N
Note car & bus circulation patterns & conflict points — ✓
Bike and ped desire lines continuously lit? (Note where if not). — Y (N)
Trip hazards? — ✓
Landscaping barriers? Mostly appropriate — ✓
Fences? — ✓
Absent ramps? — ✓
Bike/Pedestrian sight distance problems? — ✓
Review questions (Post Construction Column) from p. 6-7 of Ped RSA Checklist
Other Notes:

Kiss & Ride ped path lit for cars but trees may obstruct
Trim hedges at gaps (SD)

LEE ENGINEERING

C. Parking Areas/Adjacent Developments

Master Prompt		Detailed Prompt	RSA Stages: planning	design	construction	post-construction
C.1 Presence, Design, and Placement	C.1.1	Do sidewalks/paths connect the street and adjacent land uses? To W, yes, to E no.	✓	✓	✓	✓
	C.1.2	Are the sidewalks/paths designed appropriately? Mostly		✓	✓	✓
	C.1.3	Are buildings entrances located and designed to be obvious and easily accessible to pedestrians?	✓	✓	✓	✓
C.2 Quality, Condition, and Obstructions		See prompts in Section **A** for potential issues on obstructions and protruding opbjects that apply to sidewalks and walkways at parking areas/adjacent developments				
		See prompts in Section **A** for potential issues on surface conditions that apply to sidewalks and walkways at parking areas/adjacent developments				
	C.2.1	Do parked vehicles obstruct pedestrian paths?				✓
C.3 Continuity and Connectivity	C.3.1	Are pedestrian facilities continuous? Do they provide adequate connections for pedestrian traffic?	✓	✓	✓	✓
	C.3.2	Are transitions of pedestrian facilities between developments/projects adequate?		✓	✓	✓
C.4 Lighting		See prompts in Section **A and B** for potential issues on lighting that apply to sidewalks and walkways at parking areas/adjacent developments				
C.5 Visibility	C.5.1	Are visibility and sight distance adequate?	✓	✓	✓	✓
C.6 Access Management	C.6.1	Are travel paths for pedestrians and other vehicle modes clearly delineated at access openings?	✓	✓	✓	✓
	C.6.2	Do drivers look for and yield to pedestrian when turning into and out of driveways?			✓	✓
C.7 Traffic Characteristics	C.7.1	Does pedestrian or driver behavior increase the risk of a pedestrian collision?				✓
	C.7.2	Are buses, cars, bicycles, and pedestrians separated on the site and provided with their own designated areas for travel?	✓	✓	✓	✓
C.8 Signs and Pavement Markings	C.8.1	Are travel paths and crossing points for pedestrians properly signed and/or marked?		✓	✓	✓

Need buffer codes in footer

For Side of Street, choose:
N NE
S SE
E NW
W SW

Condition Options:
E/G = Excellent/Good
F = Fair
P = Poor
VP = Very Poor
N = Nonexistent

*All lanes for 2-way street

*Add photos of each sign; sketch signing and marking on separate map

Land Use Codes:
1 = Residential, central business districts (CBD), neighborhood commercial,parks and other public facilities, governmental buildings/plazas,offices/office parks
2 = Low density development, rural subdivisions, un-incorporated communities, strip commercial, mixed employment
3 = Light industrial, big-box/auto-oriented commercial
4 = Heavy industrial, intermodal facilities, freeway interchanges See http://www.oregon.gov/ODOT/Planning/Documents/APMv2_Ch14.pdf (Sect. 14.5) for more details.

DART Red & Blue Line Last Mile Connections Project
Field Data Checklist - Stations

Date 7/31/18
Station Downtown Plano
Staff Name

Sketch bike & pedestrian observed travel & desire lines on aerial photo inserted below: ☐
(Zoom out 1/2 block beyond station perimeter)

Are any desire lines missing a marked crossing location on a perimeter street, especially if mid-block? *(If Yes, note on sketch and add line with "New" link ID on Crossings Checklist)* (Y) N
Note bike parking locations (covered vs. rack vs. bikeshare) ✓
Do any travel routes differ significantly from linear desire lines? Y (N)
Note car & bus circulation patterns & conflict points ✓
Bike and ped desire lines continuously lit? (Note where if not). (Y) N
Trip hazards? N
Landscaping barriers? N
Fences? N
Absent ramps? ✓
Bike/Pedestrian sight distance problems? N
Review questions (Post Construction Column) from p. 6-7 of Ped RSA Checklist Y
Other Notes: noted

C. Parking Areas/Adjacent Developments

Master Prompt		Detailed Prompt	RSA Stages			
			planning	design	construction	post-construction
C.1 Presence, Design, and Placement	C.1.1	Do sidewalks/paths connect the street and adjacent land uses?	✔	✔	✔	✔
	C.1.2	Are the sidewalks/paths designed appropriately?		✔	✔	✔
	C.1.3	Are buildings entrances located and designed to be obvious and easily accessible to pedestrians?	✔	✔	✔	✔
C.2 Quality, Condition, and Obstructions	See prompts in Section **A** for potential issues on obstructions and protruding opbjects that apply to sidewalks and walkways at parking areas/adjacent developments					
	See prompts in Section **A** for potential issues on surface conditions that apply to sidewalks and walkways at parking areas/adjacent developments					
	C.2.1	Do parked vehicles obstruct pedestrian paths?				✔
C.3 Continuity and Connectivity	C.3.1	Are pedestrian facilities continuous? Do they provide adequate connections for pedestrian traffic?	✔	✔	✔	✔
	C.3.2	Are transitions of pedestrian facilities between developments/projects adequate?		✔	✔	✔
C.4 Lighting	See prompts in Section **A and B** for potential issues on lighting that apply to sidewalks and walkways at parking areas/adjacent developments					
C.5 Visibility	C.5.1	Are visibility and sight distance adequate? ✔	✔	✔	✔	✔
C.6 Access Management	C.6.1	Are travel paths for pedestrians and other vehicle modes clearly delineated at access openings? ✓	✔	✔	✔	✔
	C.6.2	Do drivers look for and yield to pedestrian when turning into and out of driveways?			✔	✔
C.7 Traffic Characteristics	C.7.1	Does pedestrian or driver behavior increase the risk of a pedestrian collision?				✔
	C.7.2	Are buses, cars, bicycles, and pedestrians separated on the site and provided with their own designated areas for travel?	✔	✔	✔	✔
C.8 Signs and Pavement Markings	C.8.1	Are travel paths and crossing points for pedestrians properly signed and/or marked?		✔	✔	✔

DART Red & Blue Line Last Mile Connections Project
Field Data Checklist - Sidewalk Gaps

Date 07/31/18
Station ~~Downtown~~ Plano
Staff Name LL HB
Location N Place (18th to N limit)

Instructions: When coding/confirming sidewalk condition of "Nonexistant" on sidewalk checklist, review the following and make notes here and/or on the sidewalk checklist.

What challenges are there to the feasibility/practicability of sidewalk?
Circle items below and add notes/sketches as applicable.

Utility poles? No

Underground utilities? Not final

Trees? 5@ feet back

Slopes? No

Other structures? No

Rail crossings? No

Business parking/access management issues? No

Insufficient bridge width? N/A

Take photos and notes to document.

* May need to buy some right-of-way close to 75

Sidewalk on S side is present between rice field & Alta Vista Apartment Driveway.

Other Notes:

Field Data Checklist - Sidewalk Gaps

Date _____
Station _____
Staff Name _____
Location 16th (between Central & E)

Instructions : When coding/confirming sidewalk condition of "Nonexistant" on sidewalk checklist, review the following and make notes here and/or on the sidewalk checklist.

What challenges are there to the feasibility/practicability of sidewalk?
Circle items below and add notes/sketches as applicable.

Utility poles? Yes, Cable

Underground utilities? maybe

Trees? No

Slopes? No

Other structures? N/A

Rail crossings? No

Business parking/access management issues? Yes, Taylor Rental

Insufficient bridge width? N/A

Take photos and notes to document. ✓

Other Notes:

Field Data Checklist - Sidewalk Gaps

Date 7/31/18
Station Dtn. Plano
Staff Name Josh
Location F Ave from 13th/14th Conn. to 14th (both sides)

Instructions : When coding/confirming sidewalk condition of "Nonexistant" on sidewalk checklist, review the following and make notes here and/or on the sidewalk checklist.

What challenges are there to the feasibility/practicability of sidewalk?
Circle items below and add notes/sketches as applicable.

Utility poles? Y

Underground utilities? Y

Trees? Y

Slopes? N

Other structures? N

Rail crossings? N

Business parking/access management issues? N

Insufficient bridge width? N

Take photos and notes to document. Y

Other Notes: Undeveloped land use ... probably wait until developed

LEE ENGINEERING

DART Red & Blue Line Last Mile Connections Project
Field Data Checklist - Sidewalk Gaps

Date 7/31/18
Station Dtn. Plano
Staff Name Josh
Location 14th E of U.S. 75

Instructions : When coding/confirming sidewalk condition of "Nonexistant" on sidewalk checklist, review the following and make notes here and/or on the sidewalk checklist.

What challenges are there to the feasibility/practicability of sidewalk?
Circle items below and add notes/sketches as applicable.

Utility poles? N

Underground utilities? Y San. Sewer

Trees? N

Slopes? Y

Other structures? N

Rail crossings? N

Business parking/access management issues? 1 driveway, rental car parking

Insufficient bridge width? N

Take photos and notes to document. Y

Other Notes:

LEE ENGINEERING

DART Red & Blue Line Last Mile Connections Project
Field Data Checklist - Sidewalk Gaps

Date 7/31/18
Station Dtn. Plano
Staff Name Josh
Location E Ave. fr. 14th to 15th
west side

Instructions : When coding/confirming sidewalk condition of "Nonexistant" on sidewalk checklist, review the following and make notes here and/or on the sidewalk checklist.

What challenges are there to the feasibility/practicability of sidewalk?
Circle items below and add notes/sketches as applicable.

Utility poles? Y ~5' b/c near 14th < 4' b/c mid-block, ~5' north end

Underground utilities? ~~None obvs~~ Verizon box, storm drain

Trees? Flower bush

Slopes? Y

Other structures? N

Rail crossings? N

Business parking/access management issues? ~~None~~ Perp. parking near 15th

Insufficient bridge width? N

Take photos and notes to document. Y

Other Notes: Seems feasible except util pol. relocate (1) prob. needed

LEE ENGINEERING

DART Red & Blue Line Last Mile Connections Project
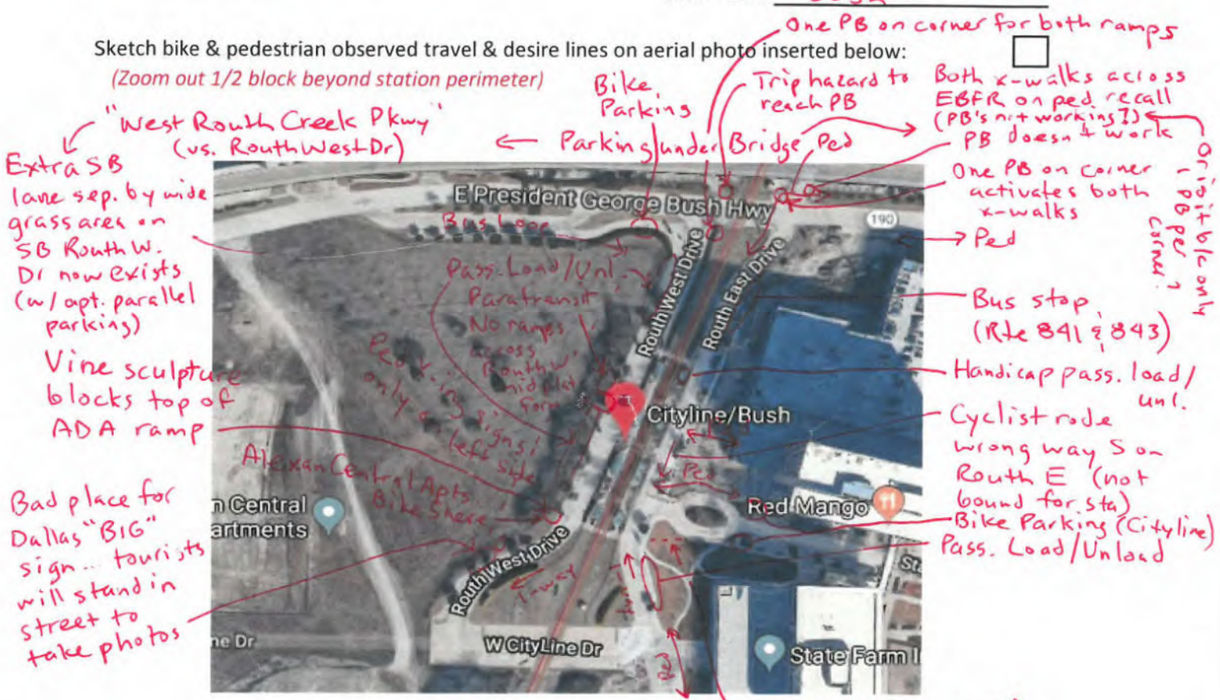
Field Data Checklist - Stations

Date 8/7/18
Station Cityline / Bush
Staff Name Josh

Sketch bike & pedestrian observed travel & desire lines on aerial photo inserted below:
(Zoom out 1/2 block beyond station perimeter)



Are any desire lines missing a marked crossing location on a perimeter street, especially if mid-block? *(If Yes, note on sketch and add line with "New" link ID on Crossings Checklist)* — Y (N)

Note bike parking locations (covered vs. rack vs. bikeshare) — No bike parking seen (but dockless bike share yes)

Do any travel routes differ significantly from linear desire lines? — Y N

Note car & bus circulation patterns & conflict points — Y N

Bike and ped desire lines continuously lit? (Note where if not).

Trip hazards? Yes, see notes

Landscaping barriers? One, see note (ADA barrier only)

Fences? N

Absent ramps? N, but very few ramps have det. warn. surf.

Bike/Pedestrian sight distance problems? N

Review questions (Post Construction Column) from p. 6-7 of Ped RSA Checklist

Other Notes:

See goat trail notes on larger station map. Incl. parking areas

LEE ENGINEERING

For Side of Street, choose:
N NE
S SE
E NW
W SW

Buffer Types:
N = None
S = Solid Surface
L = Landscaped
T = Landscaped w/ Trees
V = Vertical (retaining wall)

*All lanes for 2-way street

X = undeveloped
* Unpaved S.W.
* Blocked by bus canopy/poles
** Bus stop

Land Use Codes:
1 = Residential, central business districts (CBD), neighborhood commercial,parks and other public facilities, governmental buildings/plazas,offices/office parks
2 = Low density development, rural subdivisions, un-incorporated communities, strip commercial, mixed employment
3 = Light industrial, big-box/auto-oriented commercial
4 = Heavy industrial, intermodal facilities, freeway interchar See http://www.oregon.gov/ODOT/Planning/Documents/APMv2_Ch14.pdf (Sect. 14.5) for more details.

Station C.L / B
Staff Name HB / CF
Location Central NBFR / ~~SB~~FR ~~PG~~ PGBT to Plano Pkwy

Instructions : When coding/confirming sidewalk condition of "Nonexistant" on sidewalk checklist, review the following and make notes here and/or on the sidewalk checklist.

What challenges are there to the feasibility/practicability of sidewalk?
Circle items below and add notes/sketches as applicable.

Utility poles? No NBFR | No SBFR.

Underground utilities? Fiber | Fiber

Trees? No

Slopes? at north side of Lot 66G (NCX) | Longitudinal slopes bet⁷ trucks and RR. Yes.

Other structures? sign ~~pole~~ pole retaining wall

Rail crossings? No

Business parking/access management issues? No | No

Insufficient bridge width? N/A | N/A.

Take photos and notes to document.

Other Notes: Need move retaining wall back at N. side of building 660 (NCX)

APPENDIX C: Crosswalk Improvement Evaluation Details

At existing or proposed crosswalks without existing stop sign or signal control, potential improvements were evaluated based on guidance in the Federal Highway Administration's (FHWA) recent publication, "Guide for Improving Pedestrian Safety at Uncontrolled Crossing Locations", dated July 2018. Table 1 of this publication, reproduced herein also as Table C1, includes enhanced guidance on countermeasures that can or should be considered for uncontrolled crosswalks with various combinations of vehicular speed, traffic flow, and number of lanes to be crossed. This appendix describes how the consultant team used Table C1 to produce consistent recommendations for crosswalk improvements, as well as how roadway speed and daily traffic volume data required as inputs to the process were estimated where otherwise unavailable.

In the reproduction of Table 1, red boxes have been added to highlight an example crosswalk to illustrate how the table was used for each evaluation. In the example, four-lane undivided roadways with average annual daily traffic (AADT) over 15,000 vehicles/day and speeds greater than 40 miles per hour have up to six potential countermeasures recommended for possible consideration, as indicated by the six one-digit numbers in the lower right cell of the table. The strongest recommendations are indicated by white numbers in solid black circles. The number "1" inside an outlined circle denotes that marked and signed crosswalks should always occur in conjunction with other listed countermeasures. Numbers without circles around them indicate other improvements which may optionally be considered.

In the example, the number "1" in the lower right cell of the table indicates that high visibility crosswalk markings, parking restrictions on the crosswalk approach, adequate lighting levels, and crossing warning signs should all be employed to create a high visibility crosswalk wherever significant pedestrians demand exists or may be anticipated. But the outlined circle around the number "1" in the table indicates that implementation of these countermeasures alone is insufficent due to the high traffic volumes, high speeds, and large number of lanes to be crossed. One or more of the other options should always therefore be implemented.

The other options to be given strong consideration (based on the white number in the dark circle legend) include "Advance Yield Here for Pedestrian" signs (#3), a median pedestrian refuge island (#6), or a pedestrian hybrid beacon (#9). Other candidate countermeasures that may also be considered include curb extensions (#5) and a road diet (#8).

Note that the unavailable options for these circumstances include a raised crosswalk (#2), in-street pedestrian crossing signs (#4), and rectangular rapid-flashing beacons (RRFB's/#7). Where options such as the RRFB are listed as incompatible with context, research had demonstrated that the combination of speed, volume, or crossing distance would render the treatments less than acceptably effective. The footnotes indicate that some options are mutually exclusive of others.

A Microsoft Excel spreadsheet was created to automate Table 1 as a lookup table and quickly produce the list potentially recommended improvements given the inputs entered for each candidate crosswalk improvement location to be considered for the project. The analyst in each case still used engineering judgment to select which countermeasure options would ultimately be recommended, as indicated by the red boxes around items #1, #3 and #9 (but not #6) in the bottom right corner of the table. Notes as to the rationale for each improvement were made. The inputs, options, recommendations, and notes are tabulated in tables found in Appendix D.

The inputs to the spreadsheet analysis of crosswalk improvements were straightforward for the number of lanes in each case. Posted speed limit was also generally straightforward, though in a few cases with low posted speed limits and high number of lanes (for example, six-lane divided

Table C1: Application of Pedestrian Crash Countermeasures by Roadway Feature

Given the set of conditions in a cell,

- # Signifies that the countermeasure is a candidate treatment at a marked uncontrolled crossing location.
- ● Signifies that the countermeasure should always be considered, but not mandated or required, based upon engineering judgment at a marked uncontrolled crossing location.
- ○ Signifies that crosswalk visibility enhancements should always occur in conjunction with other identified countermeasures.*

The absence of a number signifies that the countermeasure is generally not an appropriate treatment, but exceptions may be considered following engineering judgment.

1 High-visibility crosswalk markings, parking restrictions on crosswalk approach, adequate nighttime lighting levels, and crossing warning signs
2 Raised crosswalk
3 Advance Yield Here To (Stop Here For) Pedestrians sign and yield (stop) line
4 In-Street Pedestrian Crossing sign
5 Curb extension
6 Pedestrian refuge island
7 Rectangular Rapid-Flashing Beacon (RRFB)**
8 Road Diet
9 Pedestrian Hybrid Beacon (PHB)**

*Refer to Chapter 4, 'Using Table 1 and Table 2 to Select Countermeasures,' for more information about using multiple countermeasures.

**It should be noted that the PHB and RRFB are not both installed at the same crossing location.

roadways with posted speed limits of 35 mph) a higher prevailing speed was assumed based on engineering judgment and substituted for the posted speed limit.

In many cases, recent AADT volumes for the subject roadways for the crosswalks being evaluated were available from City or TxDOT data. Historic AADT volumes were grown at 2% annually to 2019 and used directly as inputs for the crosswalk countermeasure selection analysis.

In other cases where AADT data was not already available, particularly on collector streets, a "short-cut" method for estimating AADT without collecting new 24-hour traffic counts was developed to balance accuracy with the large amount of data to be collected and the lack of precision necessary to select the appropriate sets of columns in Table C1.

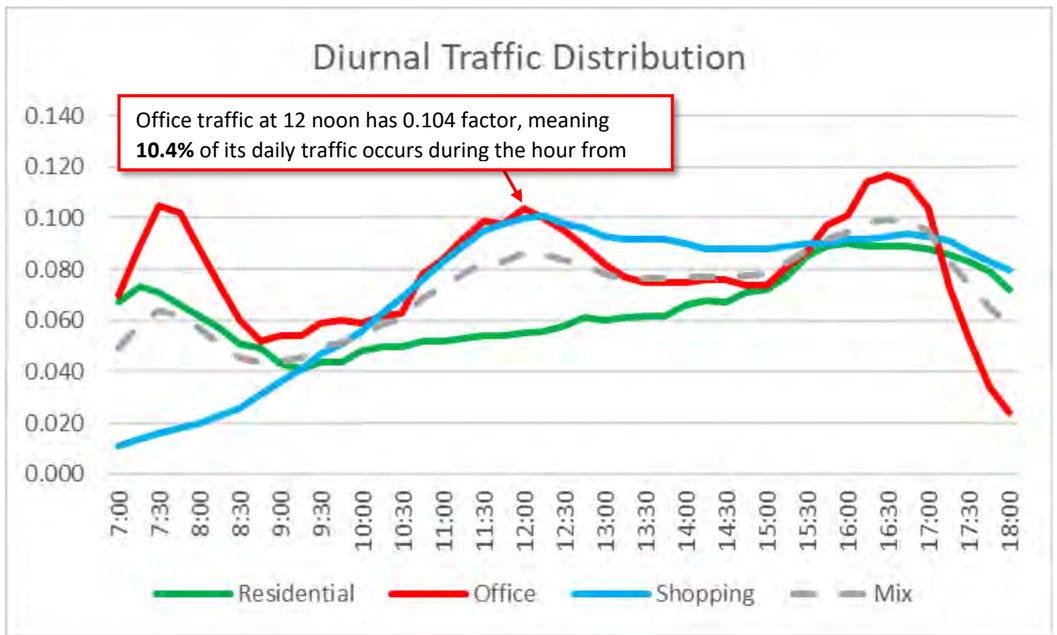
Short two-minute traffic counts were collected by consultant staff in the field at crosswalks that had been pre-selected as candidates for improvements. A two-minute time period was selected to account for the cycle length of most signalized intersections that might be nearby and therefore affect the distribution of traffic volumes. The count could be taken anytime during daylight hours to maximize field work efficiency for multiple locations.

These two-minute volumes were factored by the Excel spreadsheet program to represent approximate AADTs. The two-minute volumes are expanded to hourly volumes by multiplying by 30. The hourly volumes are then expanded to daily volumes using a lookup table based on the 15-minute period during the day that the two-minute count was taken, the adjacent land use category noted by data collection staff, and factors that were derived from data in the Institute of Transportation Engineers' (ITE) *Trip Generation Manual*, 10th Edition for the percentage of traffic generated by different land uses at different times of day.

For each crosswalk, the analysis characterized the land use contributing to traffic at a particular crosswalk as residential, office, shopping center, or a mix of the three. Figure C1 identifies the hourly-to-daily converstion factors derived for each land use by time of day. The "mix" category was computed by averaging the values from the other three land uses.

Note that office traffic has the most distinct "peaks" with the largest percentage of its traffic occuring near morning arrival, lunch hour, and afternoon departure times. Residential traffic peaks in the morning and afternoon without the distinct lunch peak, while generally increasing in the afternoon. Shopping center traffic is very low in the morning, with higher levels in the afternoon and evening.

Figure C1: Hourly to Daily Traffic Conversion Factors, by Land Use & Time of Day



To convert from hourly to daily traffic, the hourly total was divided by the selected conversion factor to get a daily traffic estimate. For example, a two-minute count of 40 vehicles taken at noon across an uncontrolled crosswalk near a large office building would first be converted to an hourly volumes of 1,200 vehicles/hour (=40 x 30). Then, the hourly volume would be converted to a daily volume by dividing 1,200 vehicles/hour by the 0.104 factor selected from Figure 7 to yield ~11,540 vehicles/day.

Note that daily traffic volume estimates derived in this way are not assumed to be accurate enough for most traffic analysis purposes, but were assumed to be valid for planning-level purposes such as selection of the appropriate columns in Table C1.

In cases where road diets were recommended, the consultant team compared the City/TxDOT AADT or estimated daily volume and the proposed number of lanes for the roadway with the maximum service volumes assumed per lane in NCTCOG's Dallas-Fort Worth Regional Travel Model, shown in Table C2. Road diets were only recommended if roadways would likely still have excess capacity after the lane reductions.

Table C2: NCTCOG Roadway Capacity for Divided or One-way Roads

LEE ENGINEERING

APPENDIX E: Half-Mile Area Improvement Prioritization – Initial Trial Methodology Details

To provide opportunities for the greatest number of additional people to walk or bike to DART stations by building sidewalk, shared use path, and crosswalk connections, the prioritization of identified improvements was structured to provide balance between estimating this objective accurately and applying the methodology to a large study area.

Initially, a prioritization scheme that attempted to track as closely as possible to potential ridership increases was tested for the Parker Road Station in Plano, with adjustments for safety, key destination access, and equity. Though some of the elements of this initial prioritization methodology were ultimately discarded for this study, they are documented here as being potentially useful for later studies on a smaller scale. Also, many of the assumptions and methodologies explained below were retained in the ultimate methodology.

For the ridership component of the initial methodology, the likelihood of land parcels around each station to contribute potential transit customers walking or biking to the station was assumed to be related to three primary factors:

1. The distance of the parcel from the station,
2. The number of people living or employed at the parcel, and
3. People's tolerance for different levels of stress experienced along the route between the parcel and the station.

For the first input to ridership, distance, NCTCOG had previously collected appraisal district parcel data from Collin and Dallas Counties and provided a GIS shapefile containing the data. Consultants used ArcGIS Network Analyst tools to calculate the distance of each parcel to the station along the nearest available walking route, which was created by editing sidewalk shapefiles provided by NCTCOG to ensure end-to-end connectivity. The NCTCOG sidewalk files were found to require significant numbers of edits in this regard.

For the second component of ridership, population density, NCTCOG had included in the parcel-level data assumed population and employment values for individual parcels in the study area that had been calculated as part of a previous project. These values had been calculated by land use based on building square footage and assumed densities (for example 300 square feet/person for office land use).

Consultants used GIS tools to tabulate the total number of people who might use each sidewalk and crosswalk segment for first and last mile trips based on the parcel population totals and the shortest distance routes along available sidewalks and crosswalks between each parcel and the station. This collection of routes was designated as the "pedestrian tree" for the station. Figure E1 shows an example pedestrian tree for Parker Road Station, with one "branch" of the tree to a 662-resident apartment complex highlighted in purple that could be shortened by constructing new sidewalk along a path worn in the grass by pedestrians who already take the shortcut.

This technique allowed modeling of how individual travelers would collectively contribute greater ridership increases along pedestrian routes with the highest density of population and employment.

Figure E1: Concept of Pedestrian Trees Illustrated

For the third assumed input to ridership, pedestrian stress could be due to uncomfortable circumstances such as high traffic speeds along the route, narrow sidewalks in close proximity to traffic, or multi-lane crossings of busy streets. This concept of "Pedestrian Level of Traffic Stress" (PLTS), was adapted for pedestrians by the Oregon Department of Transportation[1] from a similar method developed for bicyclists in 2012 by researchers from San Jose State University and the Northeastern University College of Engineering[2].

The PLTS method assigns scores to sidewalk and crosswalk segments for their levels of pedestrian stress, with scores ranging from 1 for low stress to 4 for high stress conditions. Details on the PLTS model methodology are available at the sources indicated in the footnotes.

Consultants used inputs from the field data collection in the half-mile area around Parker Road Station to create a spreadsheet program for calculating PLTS scores based on a series of look-up tables defined in ODOT's methodology, with some adaptations for local Dallas-area conditions. They then joined these scores to sidewalk shapefiles in an ArcGIS model. An example map produced from this model is shown in Figure E2, highlighting in red the higher stress PLTS 4 conditions present along higher speed arterials near Parker Road Station. Potential riders unwilling to walk along higher stress PLTS 3 or PLTS 4 sidewalks in orange and red would only have access between the Parker Road Station, its adjacent parking lots, and some commercial properties to the west, but not to any residential areas in the vicinity.

The PLTS results were then used to refine the earlier estimates of how many residents and employees might use each sidewalk and crosswalk segment for their first and last mile trips. Generalized assumptions were developed for the percentage of transit riders with trip ends within a half-mile of

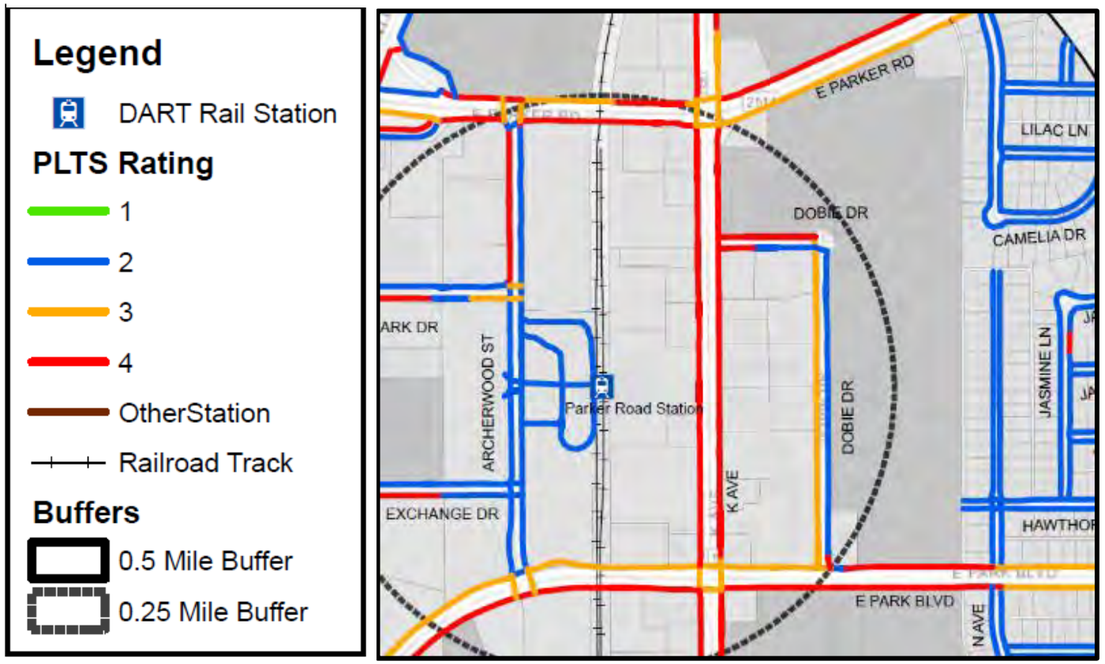

Figure E3: Data for Four Types of Cyclists Assumed Speculatively as Similar for Pedestrians

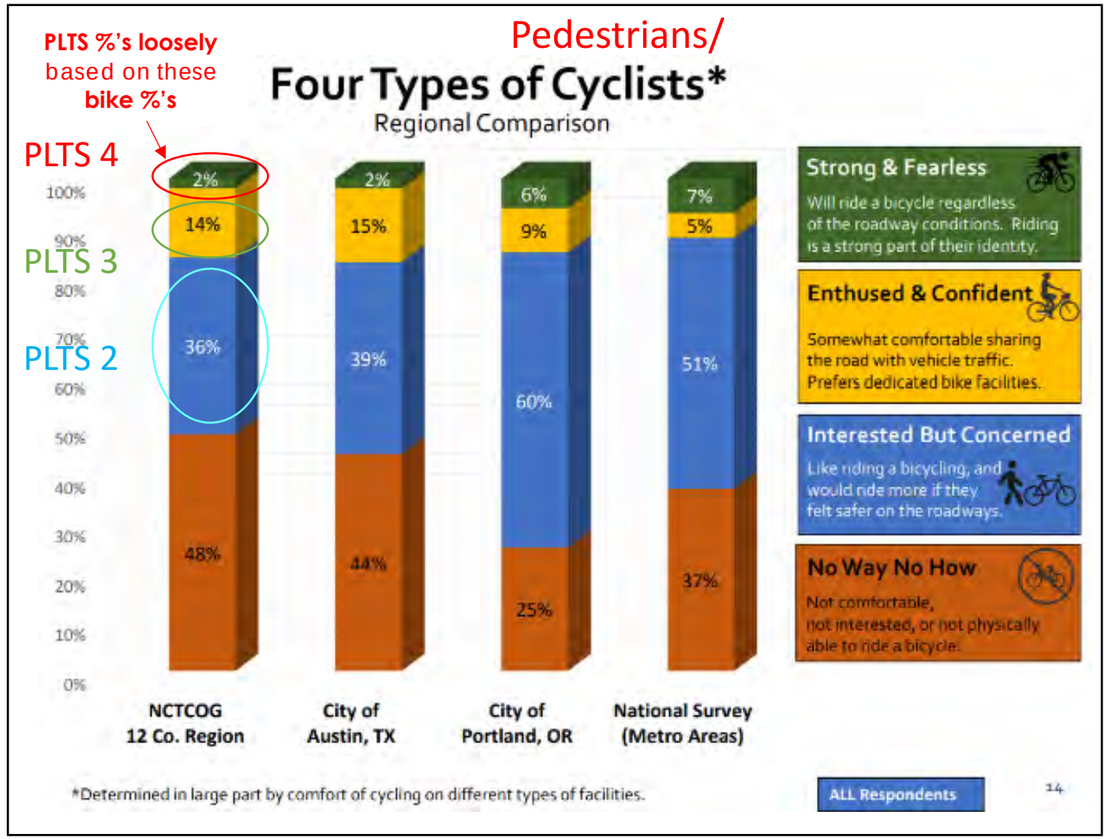


the station who would be willing or able to travel via sidewalks and crosswalks of varying PLTS stress levels. Absent more specific data, these percentages were aligned loosely (and admittedly speculatively) with survey data about the four types of cyclists as found in a recent NCTCOG survey illustrated in Figure E3. The assumed split for different groups of transit riders follows:

- 45% of transit riders were assumed to not walk or bike to transit regardless of the stress level, either based on ability or preference for car travel (similar to 48% No Way No How for bikes).
- Up to 35% of transit riders were assumed to walk or bike to transit if they could travel exclusively on PLTS 1 or PLTS 2 sidewalk and crosswalk facilities (similar to 36% Interested But Concerned for bikes).
- Up to 15% of transit riders were assumed willing to travel on PLTS 3 facilities (similar to 14% Enthused & Confident for bikes).
- Up to 5% of transit riders were assumed willing to travel on PLTS 4 facilities (similar to 2% Stong & Fearless for bikes).

More research would be ideal to investigate actual values for these assumptions.

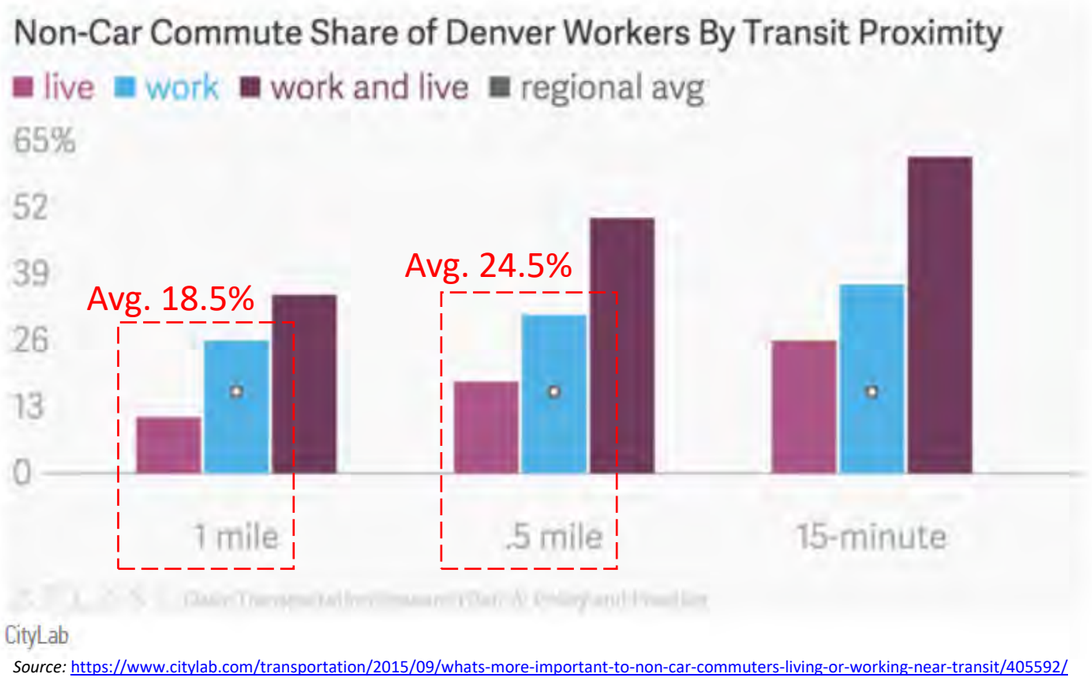
Note that some of the in the PLTS 3 or 4 categories might be termed transit-dependent riders who don't have access to a car and for whom bus transfers to the station are not sufficiently convenient.

Each of the above assumed percentages was reduced based on a sliding scale for the distance of the parcel in question from the station. The sliding scale was based on data from a 2015 University of Denver study illustrated in Figure E4 that explored the proximity relationship of the non-car commute share of Denver workers based on transit proximity. The study found that the average percentage of people living or working within 1 mile of the station who used a non-car commute mode was about 18.5%. Within a half-mile of the station, the percentage increased to about 24.5%.

As shown in Figure E5, plotting these two points from Figure E4 in a linear relationship allows for an extrapolated assumption that no more than 30% of people living or working immediately adjacent to a transit station (at a theoretical 0 mile walking distance) would use a non-car commute mode.

It was surmised that the Denver data (as with all real-world cases) would represent non-ideal conditions constrained by imperfect sidewalks and pedestrian stress levels similar to those present in the Dallas metroplex and other cities. Therefore, since the object of the above-described analysis was to account for pedestrian stress more directly, it was surmised that a nominal value of 20% be added to the equation shown in Figure E5 to normalize the relationship for ideal conditions and adjustment using the PLTS methods instead. This adjusted relationship for a proximity factor to

Figure E4: Findings of 2015 University of Denver Study



Source: https://www.citylab.com/transportation/2015/09/whats-more-important-to-non-car-commuters-living-or-working-near-transit/405592/

provide the percentage of transit riders using non-car modes to reach the station under ideal sidewalk and crosswalk conditions based on distance from the station is shown in Figure E6.

Separate ArcGIS models were created around the Parker Road Station for two different partial pedestrian networks in addition to the full existing pedestrian network described earlier. These represented pedestrian networks that would be accepted by the segments of the transit riding population "Interested but Concerned" and "Enthused and Confident" about walking or riding to the station.

One network included only PLTS 1 and PLTS 2 links as route options (the blue lines in Figure 9) and therefore served the most limited number of parcels. Another network allowed for travel on PLTS 3 segments (the orange lines in Figure 9) in addition to PLTS 1 and PLTS 2. This network would serve a larger number of parcels. An overall estimate of existing ridership for Parker Road Station was calculated using the above-described inputs. For each parcel, a separate calculation for each PLTS group of transit riders was made as follows:

PLTS 1+2: Parcel population x Proximity Factor x 35% of transit riders in PLTS Group

PLTS 3: Parcel population x Proximity Factor x 15% of transit riders in PLTS Group

PLTS 4: Parcel population x Proximity Factor x 5% of transit riders in PLTS Group

Figure E5: Extrapolated Relationship from 2015 University of Denver Study

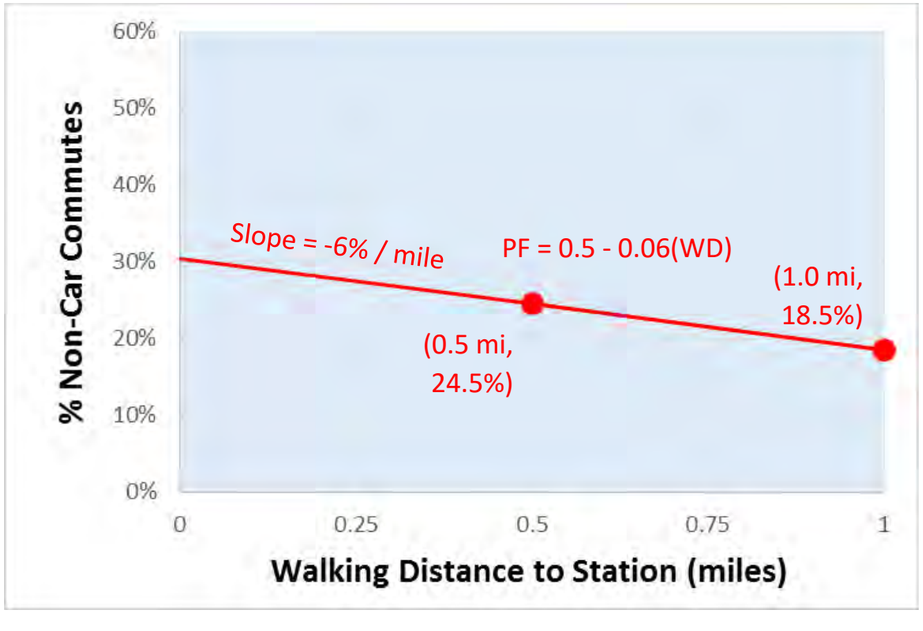


Figure E6: Adjusted Relationship Assumed for Proximity Factor

Criteria	Weight
Employment and Population Density (Number of potential riders connected by the improvement's catchment area)	50
Distance / Proximity of Improvements to the Station	25
Walkshed Trip Length Reduction (Catchment area benefitting from a reduced walk distance to the station)	5
Land Use Types and Key Destinations (e.g. schools, government buildings, social services, hospitals, large shopping centers, parks)	5
Crash History (Number of crashes in the general area of the project improvement)	5
Safety Benefit (Speed limit as a surrogate for systemic safety of the project improvement)	5
Equity / Transit Dependent Populations (Minority households, % below poverty line)	5

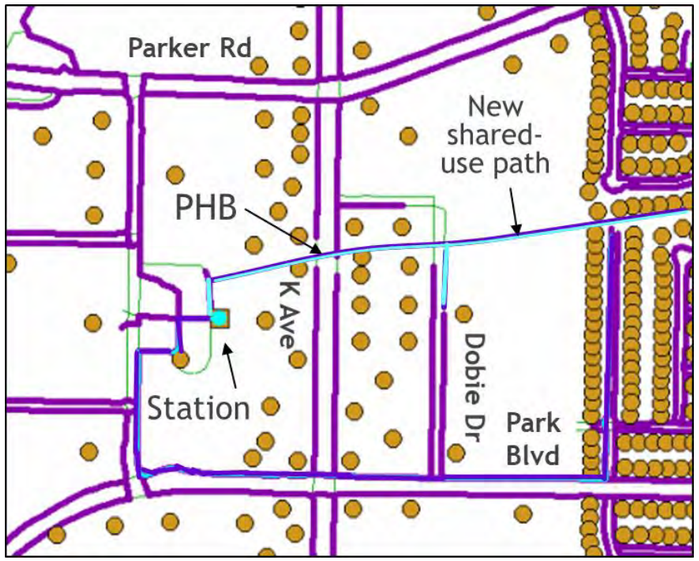
Note that the proximity factor was potentially different for each PLTS group, indicating that more selective travelers could only reach the station by following a longer path consistent with their intolerance for more stressful conditions. For parcels not connected to the station at all at a given PLTS (including PLTS 4) no ridership was assumed for that parcel as a simplifying assumption (despite the fact that many travelers, including those dependent on transit, can and do walk to the station without the benefit of sidewalk or crosswalk facilities).

The resulting estimate of existing non-car commuting trips to and from Parker Road Station was 631 people for existing conditions. This compared very favorably with 2015 survey data that had been provided by DART, indicating that 619 of the daily average riders either walked or biked to Parker Road Station.

Proposed sidewalk and crosswalk improvements were then added to the ArcGIS models for Parker Road Station so that an increase in ridership could be forecast. These are illustrated in Figure E7, which is an annotated screen capture from the GIS model where sidewalks and crosswalks are shown in purple or blue and parcel centroids are shown as brown circles.

With the originally proposed improvements, including a shared use path and pedestrian hybrid beacon (PHB) extending east of the station across K Ave, forecast ridership by non-car commute to the station was forecast to increase from 631 people to 1,018 people, a 61% increase.

Figure E7: Excerpt of Sidewalk Network, Including Originally Proposed Improvements near Parker Road Station

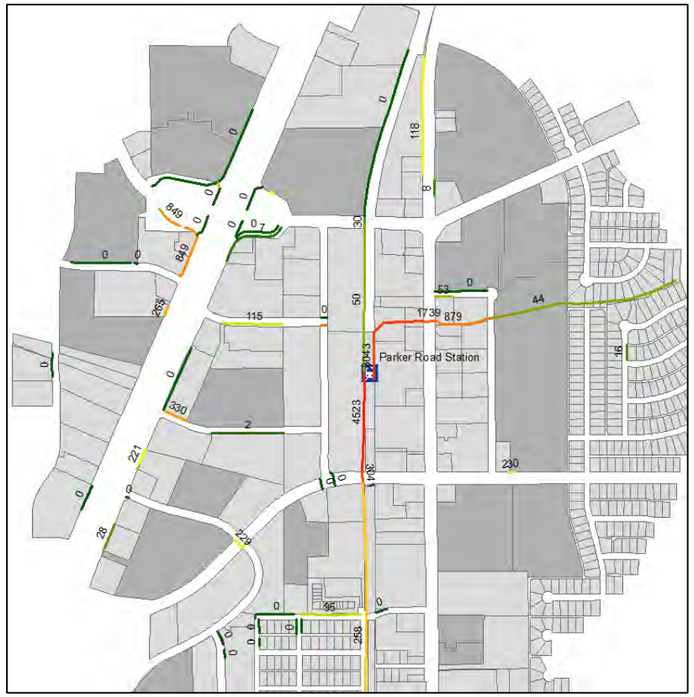


APPENDIX F: Half-Mile Area Improvement Prioritization – Final Methodology Details

After review of the process described in Appendix E, NCTCOG and the consultant team determined that the extensive editing required to the GIS shapefiles for existing sidewalks would not allow for the same level of effort at each of the 27 additional stations without compromising in other areas of the analysis. Data entry from field work could be reduced by bypassing the PLTS calculations. Finally, it was felt that some of the inputs were too speculative, despite the reasonable agreement between the existing condition model forecast and the recent DART ridership surveys.

Consequently, the prioritization process was simplified by providing separate scores for employment and population density without attempting to correlate these to ridership levels. The methods described previously were used to identify the parcel employment and population tributary to each sidewalk and crosswalk segment, without using a proximity factor or PLTS scores. Distance of each improvement from the station (measured linearly in a straight line for greater simplicity) was separated into a distinct scoring criterion, along with other scoring criteria for walkshed trip length reduction, land use types, key destinations, crash history, safety benefits, and equity. The weighting given to each criterion is shown in Table 1, in Section 2.9 of the report.

Figure F1: **Employment and Population "Tributary" to** Sidewalk & Crosswalk Improvements



Employment & Population Density

Figure F1 illustrates the process used to score improvements on the first criterion in Table 1, employment and population density. It shows the parcels in the Parker Road Station area, with darker shades of gray representing higher population/ employment totals. Note that, while some of the improvements shown in Figure F1 and other figures that follow, such as the sidewalk, pedestrian hybrid beacon, and shared use path to the east of the station, were later revised based on input from the City of Plano, the principles illustrated still apply.

In the figure, each sidewalk and crosswalk improvement link is shown in red, orange, yellow, or green colors depending on the total employment plus population that would be "tributary" to the station via the improvement once all proposed improvements are constructed. The tributary employment plus population values are shown next to each link, with the red links closest to the station having the highest values.

As a simplifying assumption, parcels straddling the half-mile boundary from the station were included in their entirety without any reductions, but parcels beyond the half-mile boundary were not considered to contribute to the analysis even though some travelers (particularly bicyclists) may be willing to travel without a car for longer distances.

Note that some improvements would have zero expected employment and population because the links connect to parcels that are currently vacant or to parcels that were assumed to have redundant, shorter routes to the station via another street or via the opposite side of the same street.

Figure F2: Proximity of Improvements to Station

Each improvement was assigned a score of 0-50 points, interpolated linearly based on the relative level of employment and population for the improvement, ranging from 0 to the maximum project-wide estimated value of 11,787.

Distance

Figure F2 illustrates the process used to score improvements on the second criterion in Table 1, distance to the station. Each improvement is shown color-coded based on the distance of its midpoint to the station, measured linearly "as the crow flies" for simplicity. Improvements that connect directly to the station have a distance of 0.0 miles. The figure shows the closer improvements shown in green and the most distant improvements in red. Points were assigned to each improvement on a linear scale ranging from 25 points for 0 miles from the station to 0 points at 0.5 mile from the station.

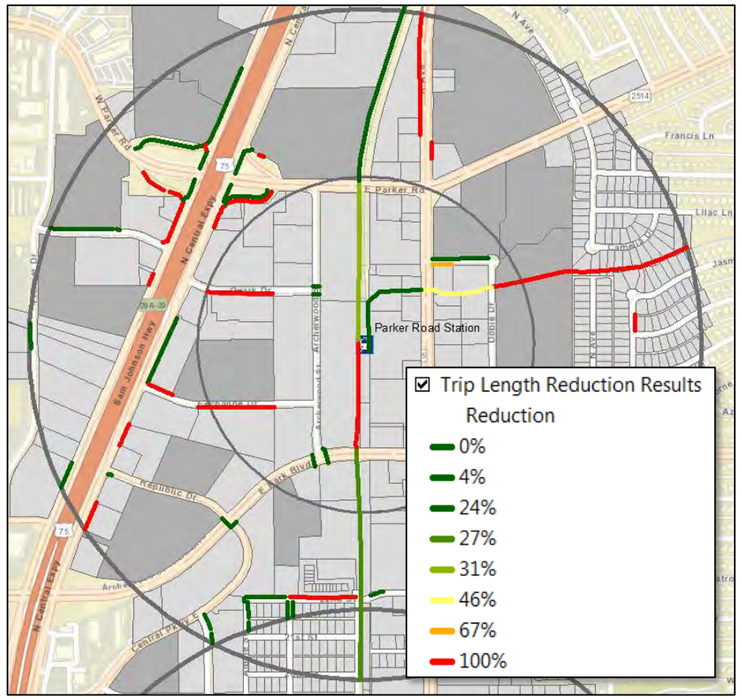
Walkshed Trip Length Reduction

Figure F3 illustrates the process used to score improvements on the third criterion in Table 1, walkshed trip length reduction. Each improvement is shown color-coded based on the percentage reduction in walking distance to the station that would occur for the population of a reference parcel selected as representative of most parcels tributary to the improvement in question. In general, the highest population parcel was chosen. When most parcels were of similar population, such as in single-family home neighborhoods, the farthest parcel was usually selected.

For each improvement, the walking distances from the reference parcel to the station along the existing and proposed pedestrian networks were measured using Network Analyst in ArcGIS. The difference between the two values was calculated as the walkshed trip length reduction.

Consideration had been given to creating a weighted average trip length reduction for all parcels, but this would have required tedious measurements and/or custom macros in ArcGIS. Therefore, this idea was abandoned for the final analysis.

Figure F3: Walkshed Trip Length Reduction



In Figure F3, improvements that would reduce trip length by a high percentage are shown in red or orange. These include improvements that would connect parcels with no existing sidewalk access to the station, which was considered for scoring purposes a 100% reduction (to avoid divide by zero errors). Lower percentages of trip length reduction are shown in yellow and shades of green. Scores for this category were assigned ranging from 0 points for no reduction in walking distance to 5 points for either a newly connected reference parcel or a reduction in walking distance greater than 40%.

Access to Land Use Types & Key Destinations

The fourth criterion for scoring improvements was access to other land use types and key destinations. Proximity to residential and employment uses had already been accounted for in the first criterion. However, other land uses with a high number of visitors also needed to be accounted for. Land uses and destinations deserving of special access consideration were as follows:

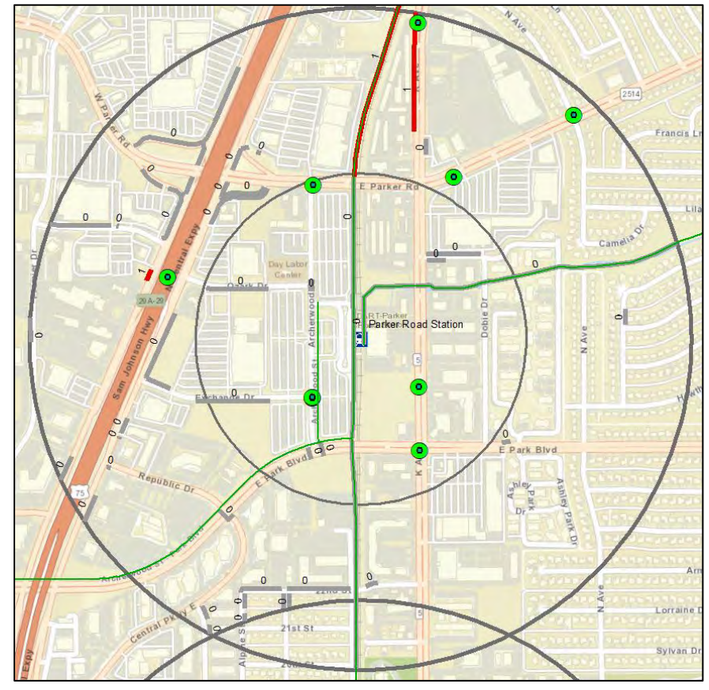
- Hospitals, clinics, urgent care
- Places of worship
- Schools
- Government buildings[3]
- Libraries, museums
- Grocery stores, malls, supercenters, hotels, motels
- Entertainment, fine arts, parks, landmarks, athletic facilities
- Senior living, community centers, gardens
- Bus stops with >25 daily boardings

A shapefile was created for locations in the above categories. Bus stop boarding information in GIS format was obtained from DART for analysis. Bus stops immediately adjacent to the DART rail stations were excluded as being redundant to the distance prioritization criteria, which already prioritizes proximity of the improvement to the station.

For each improvement, the number of key destinations within 250 feet were tabulated. Also tabulated for improvements greater than ¼ mile from the station were the number of bus *routes* within 50 feet of the improvement. The intent of this last criterion was to add emphasis on routes that would more often save time for those walking or biking to the station. Routes closer than ¼ mile were generally considered less useful for this purpose, since a walk to the station would more frequently take less time than waiting for the next bus.

For the access criterion, points were assigned ranging from 0 points for no nearby destinations or qualifying bus routes to 5 points for 5 or more nearby destinations or bus routes. Since some arterial streets may have several bus routes without necessarily having many stops or destinations nearby, the number of points contributed by bus routes was limited to no more than 3 points.

Figure F4: Relative Scarcity of Bicycle & Pedestrian Crashes



Crash History

The fifth criterion for scoring improvements in Table 1 is crash history. A GIS shapefile was used containing the point location of all reported bicycle and pedestrian crash locations for the study area from 2013 to 2017.

Figure F4 shows that in many places, such as the Parker Road Station half-mile area, bicycle and pedestrian crashes shown by green circles are relatively rare and random occurrences. In areas of lower density development and pedestrian activity, the crashes tend to be scattered throughout the study area, mostly along major arterials. Other station areas with higher density development and greater multi-modal activity experienced higher numbers of pedestrian and bicycle crashes. Since it was not possible within the scope of this project to collect pedestrian volume data, the crash data was observed to serve as somewhat of a surrogate for pedestrian demand. Therefore, a cluster of crashes may be more indicative of a place where many people walk than of a place that's more dangerous to walk in terms of the risk to individual pedestrians.

[3] in categories with an assumed high number of visitors, such as courthouses

Unfortunately, the available crash database had little detail on the nature of the crashes. For the crash shown along U.S. 75 in Figure F4, for example, the database indicated it involved a pedestrian with an incapacitating injury. However, the database did not detail what either the pedestrian or the driver involved were doing prior to the crash.

There is a sidewalk gap at this location, so perhaps the pedestrian was walking in the travel lanes of the southbound frontage road to avoid the gap. But the pedestrian could also just as well have been changing a flat tire or jaywalking across the freeway mainlanes. So, the crash data may offer some insights, but is still limited in its value for assigning relative benefits to different improvements.

The project team considered requesting police crash reports for the individual crashes and classifying them using the Federal Highway Administration's Pedestrian and Bicycle Crash Analysis Tool (PBCAT). This tool would allow for more significant insights to be drawn from a greater wealth of crash data, leading to better screening of which crash locations might be more or less susceptible to correction by certain countermeasures versus others. However, the extra effort required to code crashes was outside the scope of the project.

For the crash history criterion, improvements were scored from 0 to 5 points based on the number of bicyle- and pedestrian-related crashes within 250 feet of the improvement during the 5-year period analyzed. Figure F4 shows that only two improvements scored points near Parker Road Station. The two links in red each received 1 point for being near a single crash.

No differentiation was made in the scoring for bicycle versus pedestrian crashes or between crashes of different severity. While this data was available in the database, most bicycle and pedestrian crashes have a high potential for being serious or fatal, so it was determined any differentiation in the sparse data could be the result of statistical noise and was therefore less significant in differentiating which improvements would be of greatest benefit for positive safety outcomes.

Safety Benefit

A more recent development in transportation safety research that is designed to combat the drawbacks of traditional crash analysis mentioned in the previous section is the concept of "systemic safety." Systemic safety is a term that refers to safety approaches that are data driven, network-wide, and which consider improvements at locations with similar characteristics to high crash locations, even if the locations where improvements are to be considered or proposed don't themselves have significant crash history. The process is somewhat akin to extrapolating where it is believed crashes are more likely to occur over a longer period of perhaps 20 or 30 years, based on risk factors identified at the locations of recent crashes.

The scope for this project is in itself somewhat systemic in that areas within a half mile of light rail stations were generally observed to show higher bicycle- and pedestrian-related crash frequency than were other areas of the Dallas-Fort Worth region in general. Again, this result is not surprising due to the expected higher prevalence of multi-modal travel demand near transit stations.

As a second measure of systemic safety, the project team opted to use the posted speed limit of the roadway adjacent to sidewalk improvements or crossed by crosswalk improvements. Vehicular speed is widely regarded as having a high correlation to safety outcomes in bicycle and pedestrian crashes, as illustrated by a popular graphic in Figure F5 from the Seattle Department of Transportation.

Figure F5: Generalized Relationships between Impact Speed & Pedestrian Survival Rates

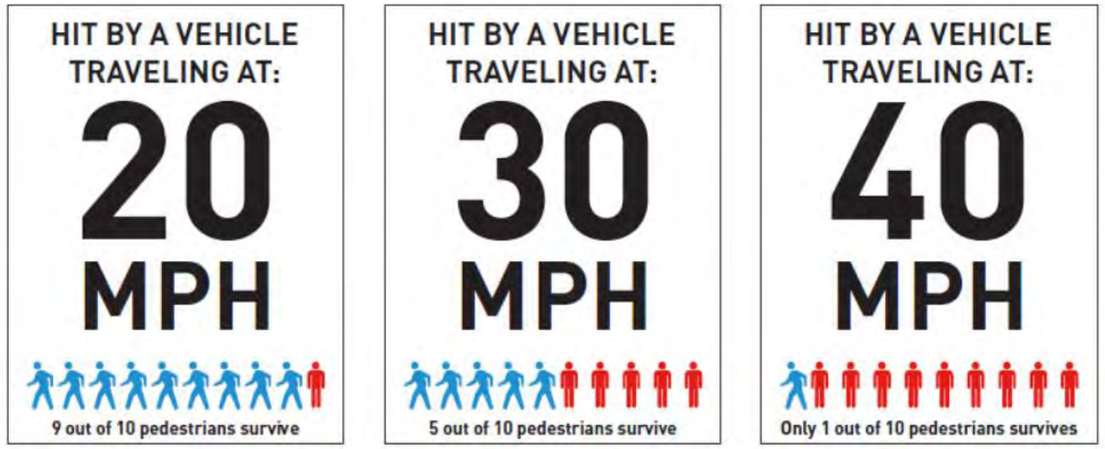


Image: Seattle Department of Transportation

The project team felt that posted speed limit was the single most important safety variable that could be easily measured and isolated, since data on posted speed was readily available in a GIS shapefile. While other variables such as 85th percentile speed and traffic volumes may be important to consider in a more detailed systemic safety study, they were determined to be outside the data collection scope of this project.

The associated scores for the safety benefit criterion ranged from 0 points at or below 20 mph to 5 points at or above 45 mph.

Shared use paths or sidewalks not adjacent to roadway alignments received 0 points for this category. Some consideration was given to assigning points for these types of off-street facilities or sidewalks along low-speed streets to prioritize safer alternatives to walking along high-speed roads. However, ultiimately it was decided that inverting the scoring system in this way would de-prioritize existing gaps along higher speed streets, which are typically the "weakest links" in the multi-modal network that lead to the greatest number of decisions to avoid pedestrian and bicycle trips.

Figure F6 shows the Parker Road Station area with the speed limit of the adjacent or crossed street identified next to each improvement, which is color-coded based on the speed limit. Red and orange improvements are near roadways with speed limits of 45 mph or greater, yellow improvements are along or crossing 40 mph roadways, and improvements are shown in green for 30 mph streets.

Equity

The final criterion for prioritizing projects was equity, which seeks to emphasize improving communities with populations that have not historically received equal access to resources. The consultants were provided spatial data covering the project area for an equity metric, the Environmental Justice Index. This index is compiled by NCTCOG to comply with federal rules for identifying Environmental Justice populations. It is based on data from the 2013-2017 American

Community Survey, aggregated at the census block level. Each census block is categorized if the percentage of its residents is higher than the regional average for minority population, low income, or both. Figure F7 shows a map of Environmental Justice Index areas for the areas including the 28 half-mile station areas for the Red & Blue Lines Last Mile Connections project.

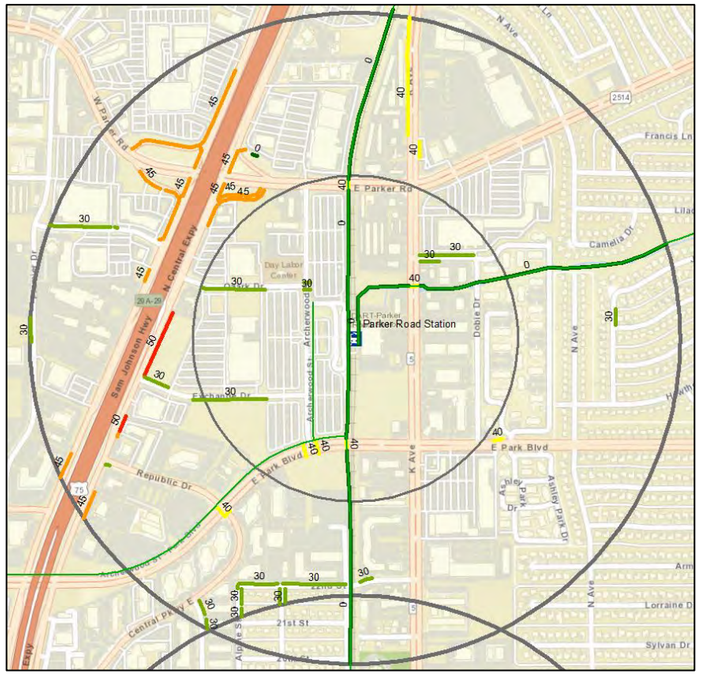
The map shows yellow areas with an above average percentage of low income residents, blue areas with an above average percentage of minority residents, and green areas with an above average percentage of both low income and minority residents. For areas where the map background is visible without any yellow, blue, or green color, no points were scored for the equity criterion. For low income and minority areas (yellow and blue), 3 points were scored for each improvement. For areas with both a higher than average percentage of low income and minority residents (green), 5 points were scored for each improvement.

Gaps to Remain

The consulting team categorized some segments where gaps in the pedestrian network had been identified by NCTCOG during preliminary GIS work to be gaps to remain for the final project listing. This decision was based on field conditions that would be impractical to analyze or would make sidewalk construction extremely cost-prohibitive. Examples include:

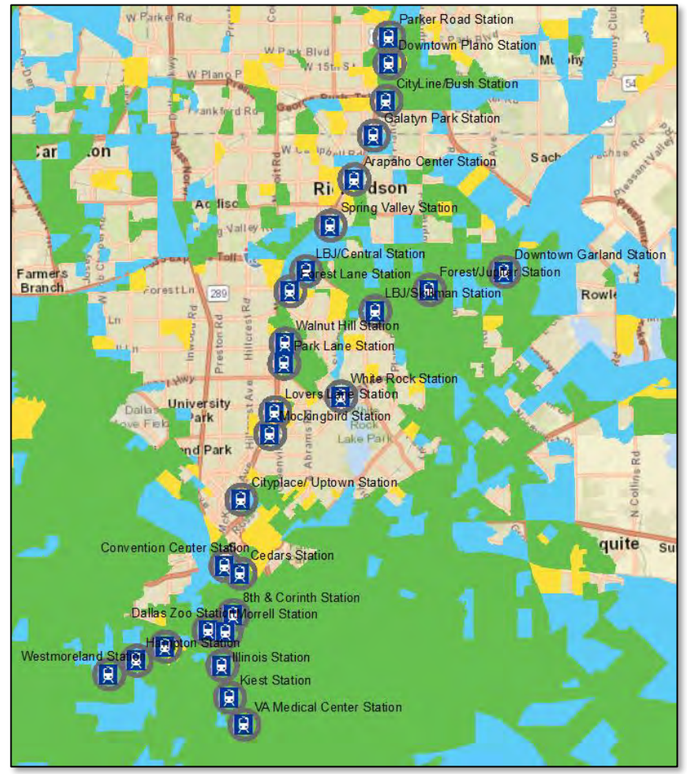
- Segments not connecting to the station without exiting the half-mile area.
- Right-of-way would be needed from a cemetery.
- Widening of existing bridge structures would be required without significant likely pedestrian demand.
- A building structure would need to be removed or modified.
- Parallel pedestrian access is provided a short distance away by a trail or another sidewalk such that new sidewalk adjacent to the street would be redundant.
- Street function is as a fire lane, service drive, or alleyway exclusively for vehicular use and pedestrian access is provided by sidewalk on the opposite side of the building.
- Inadequate space exists for sidewalk between roadway edge and DART tracks, without sufficient right-of-way or spare capacity to recommend a road diet.
- Environmental obstacles such as slopes down to creekbeds.
- Excessive impacts to residential properties (particularly those in older single-family home neighborhoods with very small yards, very short setbacks between the street and home and/or no garages or on-street parking width).
- Locked code-controlled pedestrian gates providing sidewalk access through private property (typically apartment complexes). These were modeled as gaps for the general public while still providing access to apartment residents.
- Sidewalk not needed due to lack of developable adjacent land use and existence of parallel sidewalk on opposite side of street.

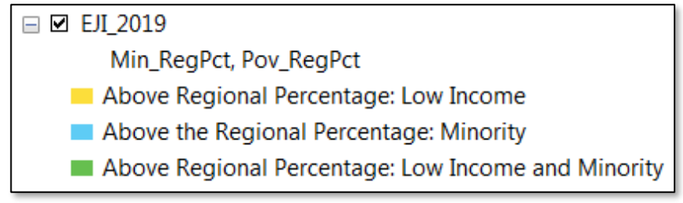
Figure F6: Improvement Scoring by Adjacent or Crossing Posted Speed Limit



- Off-street parking for small businesses blocking the way of sidewalk where parking removal would likely cause significant harm to the business.

Figure F7: NCTCOG Environmental Justic Index Mapping





In most cases where sidewalk obstacles exist, the likely challenges were documented for each improvement in notes designed to guide future planning and selection of improvements for actual projects. In some cases, the obstacles might be overcome by narrowing the roadway pavement or lane widths. If this was deemed potentially feasible, the Gap to Remain category was not used. Only where obstacles were deemed exceedingly challenging or sidewalk was judged highly unlikely to be used by anyone was the Gap to Remain category used.

Prioritization Scoring

Improvements were scored using a Microsoft Excel spreadsheet program and sorted based the overall score. The spreadsheet also summarized information on multiple consecutive GIS sidewalk

Figure F8: Screen Capture (Excerpt) from Improvement Prioritization Spreadsheet

Improvement Number	Distance		Tributary Employment & Population		Trip Length Reduction		Access					Crash History		Systemic Safety		Equity		Total Points	Priority

segments on each street block to simplify the resulting improvement tables. Figure F8 shows a screen capture from the Excel spreadsheet for Downtown Plano Station. The figure does not represent a complete listing of all improvements for this station, but is shown for illustrative purposes only. The left-hand column in Figure F8 lists the identifcation number for each improvement.

Consultants evaluated each improvement for the seven criteria described above, as shown by the column headers in the top row of Figure F8. Points were assigned for each improvement based on the values of the reference inputs.

In Figure F8, the partial list of improvements is shown sorted by total points, with possible total values ranging from 0-100 points. The rows of the spreadsheet were color coded based on the priority of the improvement, with dark red for high-priority improvements, orange for medium priority, and light pink for low priority

APPENDIX G: Cost Estimating Details

DART Station Properties

At NCTCOG and DART's direction, no additional contingencies were provided to account for the pre-design nature of the estimates, made without benefit of survey, subsurface utility investigation, or engineering design practices.

Most engineering projects at early design submittals such as 30% include additional contingencies to account for unknown design details to be addressed later in design. These contingencies are typically lowered with each successive design submission and then minimized by final 100% design submission once all design procedures have been completed.

Without additional contingencies to supplement the preliminary nature of the OPCC's, the uncertainty inherent in this decision was mitigated by a general attempt to be conservative in quantity and unit price estimation. Unit prices and other elements of the OPCC's were developed consistent with the assumptions used for the half-mile areas surrounding each station.

Half-Mile Areas

Opinions of Probable Construction Cost (OPCC) were developed for each high-priority improvement that was not assumed by City staff to be built as part of another project (developer, City, TxDOT, etc.) in the near future.

OPCC's were not developed for *individual* low- or medium-priority improvements, but could be developed by the City in the future based on similar assumptions as outlined below. Rather, estimates for the overall cost of low- and medium-priority improvements were developed on a unit length basis for each station area. The low- and medium priority OPCC estimates are therefore of a lower fidelity and thus the City may consider verifiying them with more detailed individual improvement estimates prior to making further design or construction funding decisions.

The following is a discussion of simplifying assumptions that were made in order to provide quality, yet preliminary OPCC's for the DART Station on-site improvements and nearly 1,100 separate high-priority improvements totalling nearly 58 linear miles over the 28 station areas project-wide.

Table G1 lists the project-wide number and length of improvements *not* assumed to be built by others. The listing is organized by station area, priority and type of improvement (sidewalk/shared use path vs. crosswalk).

Unit Costs

Consultants compared TxDOT and City of Dallas unit prices from recent bid tabulations for various items related to construction of the proposed improvements.

Adjustments were made in the comparisons due to differences in how the specifications, measurement, and payment for the City of Dallas and TxDOT are written. For example, the comparisons were made more balanced by averaging the Dallas values for different spellings of the same item number, or by adding remove and replace items together for comparison with an item that included both in the other agency's specifications.

TxDOT unit prices were in most cases much less expensive for sidewalk related items. This may be because TxDOT is the beneficiary of economies of scale from their contractors on projects of larger size where the items being constructed are contiguous, even though the City on their projects probably builds more sidewalk-related items overall. While this theory is impossible to confirm, since the Dallas prices don't have meta-data like TxDOT does on the quantities and number of times each item was used, the project team felt this effect was most likely present in the data nonetheless.

The City of Dallas bid tabulations also featured a wider array of bid items that would be used in these type of projects compared to the TXDOT standard bid items. Nonetheless, there were some bid items identified from TxDOT that were not available in the City list of bid items. In these cases, or when TxDOT listed a higher, more conservative unit price, the TxDOT items were used for OPCC's for this project.

In all other cases, including for the unit price for sidewalk, City of Dallas unit prices were used. The project team believes that City of Dallas prices would more likely reflect what local contractors would be bidding for sidewalk projects based on size of the proposed construction packages and our experience completing these type of projects in the DFW Metroplex.

Standard Assumptions

The following standard assumptions were used for most OPCC's developed for this project, though exceptions were sometimes made on a case-by-case basis as per engineering judgment.

Facility Width & Alignment

- All new and reconstructed sidewalks were assumed to be 5 feet wide.
- All shared use paths were assumed to be 10 feet wide.
- Sidewalks and shared use paths were assumed to have alignments that could meander slightly around obstacles if necessary and if permitted by the apparent right-of-way width.

Buffer Space & Setbacks

- Reconstructed sidewalk was assumed to be set back from the street where remnants of existing sidewalk had also been set back.
- For new sidewalk, a buffer between the sidewalk and roadway edge was assumed where the apparent available right-of-way seemed to be generally at least 8 feet wide.

Curb & Gutter

- Where sufficient space for buffers did not appear to exist, or where existing, damaged sidewalk that needs to be replaced is attached to the roadway curb, removal and replacement of any existing curb and gutter was assumed to also be necessary, so these costs were also included.
- New curb, gutter, and drainage systems were assumed to be necessary where not existing adjacent to sidewalk gaps.

Retaining Walls

- Retaining walls were estimated to be needed for certain lengths and heights based on engineering judgement where slopes were deemed steep enough to require them.
- Unit costs for retaining walls were estimated based on City of Dallas standard details for short retaining walls and the unit prices for their component features as follows:
  - 1' wall height = $20/linear foot
  - 2' wall height = $40/linear foot
  - 3' wall height = $75/linear foot
  - 4' wall height = $100/linear foot
  - 5' wall height = $125/linear foot

Landscaping

- A two-foot strip of sod was assumed to be needed on each side of the work area in addition to the landscaping allowance noted below.
- Removal and replacement of trees were developed as a blended cost estimate between TxDOT costs for the item "Remove Tree and Install Plant Material" and City of Dallas costs for installing trees.

Driveways

- Standard sizes were developed for assumed reconstruction of residential and commercial driveways where needed to construct level sidewalk crossings. The standard sizes (250 sq. ft. for residential and 500 sq. ft for commercial) helped simplify the task of making variable estimates for hundreds or thousands of driveways project-wide. Instead, estimators needed only to count the number of each type of driveway likely to be affected.
- Greater variability than indicated in the estimates may be expected in the actual construction cost in areas with steeper slopes near driveway crossings.

Table G1: Summary Improvement Statistics by Station Area, Priority & Improvement Type

Station Area		High Priority Improvements				Medium Priority Improvements				Low Priority Improvements				Gaps to Remain

Total High-Priority Improvements (Sidewalks + Shared Use Paths + Crosswalks) = 1,082
Total High-Priority Improvements (Sidewalks + Shared Use Paths + Crosswalks) = 56.39 miles

Streetlighting

- Where new streetlighting was recommended in conjunction with proposed crosswalk improvements, standard unit prices for the entire installation were developed for different roadway cross sections as follows:

- Two-lane undivided street = $26,500
- Three-lane undivided street = $27,200
- Four-lane undivided street = $40,500
- Four-lane divided street = $41,200
- Six-lane undivided street = $41,900
- Six-lane divided street = $42,700

- For purposes of the OPCC's, streets with medians less than 6' wide were considered undivided, with luminaire poles only on intersection corners rather than mounted in the median.

- For segments of new streetlighting along sidewalk segments on DART property, site-specific streetlighting estimates were developed.

Signals & Beacons at Crosswalks

For crosswalks where proposed traffic signal, Pedestrian Hybrid Beacon (PHB), or Rectangular Rapid Flashing Beacon (RRFB) installations are recommended, the following standard unit prices per installation were developed based on improvement type and roadway cross-section, based on typical recent experience with previous projects:

- RRFB – Three-lane crossing without median island - $24,000
- RRFB – with one solar unit sign with flashers/pushbutton in median refuge island - $36,000
- RRFB – with two solar unit signs with flashers/pushbutton in median refuge island - $48,000
- PHB or Pedestrian Traffic Signal – Three-lane undivided - $150,000
- PHB or Pedestrian Traffic Signal – Four-lane divided - $175,000
- PHB – Six-lane divided - $200,000
- Pedestrian Traffic Signal – Six-lane divided - $210,000
- Add APS pushbuttons, countdown pedestrian heads at existing signal - $3,500 per intersection + $6,000 per crosswalk

Road Diets

- Where road diets are recommended to provide shorter pedestrian crossings and/or provide space for pedestrian amenities such as median refuge islands and posts for signs, beacons and/or pushbuttons, the recommendations are made for consideration with the understanding that further, corridor-wide analysis outside the scope of this project will be required.

- The costs estimated are for making changes within a block in either direction of the pedestrian crossing, which would likely be the minimum viable improvement. In many cases, cities may consider a longer corridor for road diet implementation if spare capacity for auto traffic along the route is confirmed. However, costs associated with additional project length, or other costs associated with reconstructing curbs and islands beyond the one-block transition area or changes to signalized intersections, have *not* been included since they would difficult to estimate without additional study.

Median Anti-Climb Fencing

At a few locations where eliminating barriers to more direct pedestrian travel was determined to be impractical, aesthetic, anti-climb fencing is recommended to channelize pedestrians to the safest street crossings a reasonable distance away. City of Dallas and TxDOT standard bid items were found to be insufficient to account for this type of fencing. Consultants identified two aesthetic, anti-climb fencing system products and requested pricing information on each from vendors and contractors. Photographs of the types of fencing available have been included in the figures shown previously for the relevant locations.

Criteria in identifying a suitable type of fencing for these applications were that it be tall enough and without hand or finger holds to allow it to be climbed. Also, since several systems would be installed in close proximity to moving traffic, it should either be crashworthy as a stand-alone installation or capable of being mounted on crash-tested standard median concrete traffic barrier.

One type of custom fencing identified had been built in recent years along the relatively narrow median of a high-speed state highway near touristed beach areas in Ocean City, Maryland. Consultants spoke with the vendor who provided the fencing and the contractor who built it. It was built to resemble a white picket fence, with pointed bars at the top to discourage climbing. The fencing was mounted on breakaway supports and a specially designed concrete foundation for wind loading in an area prone to hurricanes.

The contractor indicated the bid cost for this fencing was about $440 per linear foot, which included all miscellaneous related items such as mobilization and temporary traffic control. The same wind load and foundation design would not likely be required for fencing in North Texas, but it isn't clear how much cost savings might be achieved with this change.

The contractor did not have examples of this type of fencing being built on top of concrete traffic barrier that would reduce the maintenance requirements for the fencing. If struck by errant vehicles traversing the curbed median, a significant amount of labor would be involved in replacing damaged sections.

The other type of fencing system identified was the ClearVu Invisible Wall system from Cochrane USA. This system was used as median pedestrian fencing in a recent project by TxDOT in the City of Fort Worth on Lancaster Ave. Quotes for fencing systems were obtained from Cochrane USA for the specific locations recommended for this proejct. Pricing varied from $52 to $73 per linear foot for the entire system, depending mostly whether the fencing was to be installed on ground mounted posts in wide medians or away from roadways or on top of concrete traffic barriers in narrow medians.

For the Lancaster Ave project, where a wide median was available, TxDOT indicated that bid prices including contractor labor for the project were about $90 per linear foot. However, a representative from the contractor was also contacted and indicated that he would bid a higher price of $130 to $140 per linear foot for future contracts. Their experience after installing the fencing for the first time was that it was a labor-intensive process that would not go more quickly with additional experience. Another local contractor who has installed this type of fencing on other projects indicated a typical bid price of $110 to $120 per linear foot.

After reviewing the above information, consultants decided on a unit cost of $130 / linear foot for anti-climb pedestrian fencing. This was based on 6' high fencing for stand-alone applications, or 3.5' fencing on top of 2.5' tall concrete traffic barrier for a total barrier height of 6' in narrow median applications. The $130 per linear foot value provides for a relatively generous extra labor allowance for the Clearview Invisible Wall system and/or for vendors of other similar products to be identfied.

Where median anti-climb fencing is recommended on top of concrete traffic barrier, standard TxDOT bid items for constructing concrete traffic barrier and end treatments were assumed independent of the cost of the remainder of the fence.

Right-of-Way

- No right-of-way acquisition is assumed for any improvements. Right-of-way data was unavailable for the high-level planning purposes of this study. Some assumptions about the apparent right-of-way location were made based on factors such as the location of utility poles in order to make other assumptions necessary for cost estimation.

- Some improvements on private property (such as that of hospitals or other large employers) assume that cooperation of the property owners and negotiation of easements would be necessary. However, no additional cost has been assumed for these activities.

Contingencies

The following contingencies (totaling 25%) were applied to all costs, as directed and approved by both NCTCOG and DART:

- 10% design fee
- 4% mobilization
- 4% for landscaping allowance
- 2% for Erosion & Sediment Control Allowance
- 3% for traffic control
- 2% extra contingency for federal aid project

At NCTCOG and DART's direction, no additional contingencies were provided to account for the pre-design nature of the estimates, made without benefit of survey, subsurface utility investigation, or engineering design practices.

Most engineering projects at early design submittals such as 30% include additional contingencies to account for unknown design details to be addressed later in design. These contingencies are typically lowered with each successive design submission and then eliminated at final 100% design submission once all design procedures have been completed.

Without additional contingencies to supplement the preliminary nature of the OPCC's, the uncertainty inherent in this decision was mitigated by a general attempt to be conservative in quantity and unit price estimation, as already discussed.

APPENDIX H: Estimated Quantities & Opinions of Probable Construction Cost – Station Property Improvements

Station Improvements Matrix

Parker Road Station

Opinion of Probable Constr. Cost = $361,650

PR ← Station Abbreviation
01 ← Improvement Number (matches 1 on Map)

North Central Texas Council of Governments
DART Red & Blue Line Corridors Last Mile Connections

Location ID	Ownership	Project Type	Description	Opinion of Probable Cost
1A-PR-ST-01	DART	Lighting	Add pedestrian lighting for area where tree cover makes for dark nighttime conditions.	$ 63,000
1A-PR-ST-02	DART	Fencing	Close gap in hedges that appears to imply this as a valid location for crossing the bus loop. Consider fencing to redirect pedestrians. The lack of ramps or a crosswalk across the bus loop here makes this an inappropriate location for a crossing. A fire hydrant here is likely the reason for the gap in the hedges, so fire hydrant access from the bus loop should be preserved.	$ 600
1A-PR-ST-03	DART	Multi-Use Trail	Add Regional Veloweb shared use path to connect platform more directly to Parker Road to the north. Will require grading, new fence between parking lot and tracks, and drainage modifications. Concrete drainage swales drain parking lot downhill toward the east at several locations across proposed path alignment, so additional study will be required.	Separate Project
1A-PR-ST-04	DART	Bicycle Parking Signing	Add educational signing at all covered bike parking locations regarding rules of use. Existing covered bike parking lids were locked. Several of the locked lids were empty without bikes inside or were storing personal belongings. The locking of empty lids indicates a shortage of available covered bike parking.	$ 900
1A-PR-ST-05				$ 900
1A-PR-ST-06	DART	Bicycle Parking	Add additional covered bike parking, preferably closer to train platform (at Location 4).	$ 16,100
1A-PR-ST-07	DART	ADA Ramp or Relocate ADA Parking	Relocate ADA parking from Location 7 closer to the north crosswalk to the train platform (near Location 3). Reasons for this change are: • Ramps are absent for crossing the southbound tracks east of the bus loop (near Location 6). • Much of the ADA parking for the station is in the small parking lot immediately west of the bus loop (Location 7 and southwest of Location 10). Some ADA parking is already located southwest of the platform near Location 14. • The lack of ramps near Location 6 requires passengers in wheelchairs to travel to the compliant crosswalks at the north or south ends of the platform (Locations 7a or 7b) rather than the more direct route via the central crosswalk.	$ 24,300
1A-PR-ST-08	DART	Crosswalk Markings	Add 12” white markings on each side of brick paver crosswalks. Bus loop crosswalks are stop-controlled, but need white markings outside the brick area to be legal crosswalks.	$ 1,500
1A-PR-ST-09				
1A-PR-ST-10	DART	Crosswalk Signs and Markings	Add pedestrian warning signs and 12” white markings outside brick pavers for Kiss & Ride crosswalk. (Crosswalk is raised to slow drivers but not signed or marked.)	$ 2,300
1A-PR-ST-11	DART	Sidewalk Repair	Correct trip hazard on sidewalk.	$ 500
1A-PR-ST-12	DART	Landscaping	Trim hedges or replace with easier maintenance plants so they don’t encroach on sidewalk.	$ 6,400
1A-PR-ST-13	DART	Landscaping	Close hedge gap that provides access to existing covered bike parking (at Location 5). Gap in hedges is convenient for bicycle access to existing covered parking, but lacks ramps and conflicts with bus loop. Provide bike parking closer to platform as indicated at Location 4 above.	$ 300
1A-PR-ST-14	DART	Multi-Use Trail	Add new shared use path connecting platform more directly to Park Blvd to the south on planned Regional Veloweb alignment. May require relocation of utilities or removal of trees and/or parking spaces.	Separate Project
1A-PR-ST-18	DART	Add anti-climb fencing	Add taller anti-climb fence along east DART property line from north end of tail track to southeast corner of platform to channelize pedestrian crossings to new connection via Plano City property to the southeast	$ 211,250
Opinion of Probable Cost - DART Subtotal				$ 328,050
1A-PR-ST-15	City of Plano	Sidewalk	Add connection via City-owned property south of platform. Additional study will be required.	Separate Project
1A-PR-ST-16	City of Plano	Tree Trimming	Trim tree blocking flashing light for crosswalk.	Negligible

DART Red & Blue Line Corridors Last Mile Connections

Location ID	Ownership	Project Type	Description	Opinion of Probable Cost
1B-DP-ST-01	DART	Bicycle Parking & Signing	Increase supply of covered bike parking. Three covered bike spaces at Location 1a north of the platform were observed locked but empty at 7 am, indicating unmet demand. Locate new bike parking near south end of platform (near Location 1b) for improved access for cyclists traveling to and from the south. At both locations, add signing to discourage improper use of covered bike parking.	$ 12,350
1B-DP-ST-02	DART, City of Plano	Regional Veloweb Shared Use Path, Crosswalk Improvement	Build multi-use trail on proposed Regional Veloweb alignment west of DART tracks and on north side of 15th Street west of tracks. Where the future trail alignment crosses 15th Street, existing pedestrian demand already exists, as shown in the photo for Location 2. Crosswalk signs & markings, a median cut-through island, and ADA ramps are needed here. Pedestrians, including one wheelchair user, were observed crossing 15th Street between the tracks and the railroad crossing gates due to the lack of an accessible path. The City of Plano reports construction of this crosswalk improvement as part of CIP project 6993.	Separate Project

Opinion of Probable Cost - DART Subtotal $ 12,350

North Central Texas Council of Governments
DART Red & Blue Line Corridors Last Mile Connections

Location ID	Ownership	Project Type	Description	Opinion of Probable Cost
1C-CB-ST-01	DART	Tourist Sign Relocation	The Dallas tourism "BiG" sign on Routh West Dr just south of the station should be reversed to face the opposite direction or the sign should be relocated to a safer position. The sign faces the street, a poor orientation since those taking photographs of others posing at the sign will be tempted to stand in the travel lanes.	$ 900
1C-CB-ST-02	DART	ADA Ramp Adjustment	Widen the ADA ramp to Routh West Dr from the south end of the platform to allow wheelchair users to bypass the large vine sculpture blocking the top of the ramp.	$ 2,800
1C-CB-ST-04	DART/City of Richardson	Warning Signs & Ramps	Add pedestrian warning signs on the right-hand side of the roadway at the six crosswalks to the station platform across Routh East Dr and Routh West Dr. Existing signs are mounted on the left-hand side only. (The signs on the west side of Routh West Drive would be on City of Richardson property, but the signs on the east side of Routh East Drive would be on DART property). Add missing ADA ramps at two of the same locations. Of the total $10,400 cost listed at right, half is assumed attributable to DART and half to City of Richardson.	$ 10,400
1C-CB-ST-07	DART/ TxDOT/ City of Plano	Sidewalk, Crosswalk Signs & Markings, PHB	Construct a new, short segment of sidewalk on the west side of the Crawford Rd/Topridge Dr crossing under the PGBT, near the north end of the underpass adjacent to the PGBT westbound frontage road (WBFR). Add marked, signed crosswalks across the east and west legs of the WBFR. The existing sidewalk on the west side extends north from the PGBT eastbound frontage road (EBFR), but ends just south of the WBFR. These crosswalks would provide added conspicuity for pedestrians who decide crossing at the signal proposed at Location 8 would be too far out of their desired travel path. Provide pedestrian hybrid beacon with advance "Yield Here to Pedestrians" signing for crossing PGBT westbound frontage road. Cost amount shown at right (1/3 of overall cost) is assumed shared responsibility by DART, with remainder by TxDOT and City of Plano. See half-mile area improvements 1C-CB-CW-042 and 1C-CB-CW-043 for more details and cost information.	$ 63,000
1C-CB-ST-08	DART/ City of Plano/ City of Richardson	Sidewalk	Construct new sidewalk on the east side of the Crawford Rd/Topridge Dr crossing under the PGBT between the PGBT westbound frontage road (WBFR) and eastbound frontage road (EBFR). Cost amount shown (1/3 of overall cost) is assumed shared responsibility by DART, with remainder by the Cities of Plano and Richardson. See half-mile area improvement 1C-CB-CW-056 for more details and cost information.	$ 13,100
1C-CB-ST-09	DART/ TxDOT/ City of Richardson	Crosswalk Signs & Markings, PHB	Add a crosswalk across the east leg of the PGBT Eastbound Frontage Road (EBFR) at Topridge Dr. Provide pedestrian hybrid beacon with advance "Yield Here to Pedestrians" signing. See also half-mile area improvement 1C-CB-CW-059. Cost amount shown (1/3 of overall cost) is assumed shared responsibility by DART, with remainder by TxDOT and/or City of Richardson. See half-mile area improvement 1C-CB-CW-056 for more details and cost information.	$ 59,000
Opinion of Probable Cost - DART/Mixed Ownership Subtotal (DART Portion of Costs Only)				$ 144,000
Opinion of Probable Cost - City of Richardson Subtotal				$ 5,200
1C-CB-ST-03	DART/ Private Property	Sidewalk	Coordinate with the adjacent property owner to add a direct sidewalk connection between train platform & bus loop. A worn path in the grass ("goat trail)" exists between the southwest corner of the Alexan Central Apartments dog park on Pipeline Dr and the DART bus stops along the PGBT eastbound frontage road. This is the most direct route between the train station platform and the bus stops, shorter than walking north along Routh West Dr and the frontage road. See off-site improvement 1C-CB-CW-071. No assumed cost responsibility by DART.	$ -
1C-CB-ST-06	DART/ Private Property	Sidewalk	Coordinate with the adjacent property owner to construct a short segment of sidewalk for more direct travel between the southern crosswalk to the train platform and the south sidewalk along State St. A "goat trail" cuts the corner where the existing sidewalk is offset from the crosswalk, indicating existing pedestrian demand. See off-site improvement 1C-CB-CW-044. No assumed cost responsibility by DART.	$ -
Opinion of Probable Cost - DART/Private Property Subtotal				$ -
1C-CB-ST-05	TxDOT	Sidewalk repair	Repair the sidewalk panel where settlement has created a trip hazard near the pedestrian pushbutton on the north side of the President George Bush Turnpike (PGBT) eastbound frontage road at Routh West Dr.	$ 3,400
1C-CB-ST-10	TxDOT	Add Traffic Signal with Crosswalk Markings	Coordinate with TxDOT to add signalized crosswalk across the PGBT WBFR just east of the track crossing. This crosswalk will provide safer access to the DART station for residents of the apartments on the north side of the westbound frontage road. See off-site half-mile area improvement 1C-CB-CW-045 for more details. This improvement is being constucted as part of the Silver Line Project.	$ -
Opinion of Probable Cost - TxDOT Subtotal				$ 3,400
General	---	Pedestrian Ramps	Many pedestrian ramps in the station area are missing detectable warning surfaces, which should be added.	N/A
Opinion of Probable Cost - Total for All Recommendations at Station				$ 152,600

DART Last Mile Connections Project - CityLine/Bush Station Station Preliminary Opinion of Probable Construction Cost

Improvement No./ Description	City of Dallas Bid Item No.	Item Description	Unit	Unit Price	Quantity	Rounded Quantity	Bid Estimate	Assumptions
1C-CB-ST-01	728	REMOVE AND RESET SIGN	Each	$ 223.00	3	3	$ 669.00	"BIG" was assumed to be 3 signs

APPENDIX I: Half-Mile Area Recommendation Details & Detailed Improvement Mapping

Figures 1A-3, 1A-4, 1B-3, 1B-4, 1C-3 and 1C-4 on the following pages of this appendix identify existing conditions and recommended improvements for the half-mile areas around each station in Plano. The first figure in each set indicates existing conditions and the second figure indicates the recommended improvements.

In each figure, existing sidewalks are shown in light blue, as well as Regional Veloweb shared use paths (bright green) and local shared use paths (dark green). Existing shared use paths are shown with solid lines, while proposed shared use paths are shown in dashed lines.

The density of individual parcels' population plus employment totals are shown in a multi-color scale on the existing conditions figure. The population and employment density is shown in grayscale on the recommended improvements figure to allow the improvements to stand out more clearly.

Sidewalk and crosswalk gaps are shown in red on the existing conditions figures, and in multiple colors on the recommended improvements figures, according to the priority assigned to the gap: red for high-priority, orange for medium-priority, and light pink for low-priority. Gaps to remain are shown in dark pink. For more details on these gap categories, refer to Appendix F.

Each high- medium- and low-priority improvement, along with all gaps to remain, are indicated by the boxed number labels near each improvement location. The lower right corner of each recommended improvements figure includes a legend that describes the abbreviations in the improvement ID codes, which can be used to cross-reference the improvement matrices that appear in Appendix J.

For solid red, orange, or light pink lines, the recommended improvement for a sidewalk gap is either a new or repaired 5-foot wide sidewalk along the length shown. Repairs are noted in the matrix notes for each improvement in Appendix J, and assume full removal of damaged, existing sidewalk prior to replacement.

Note that in some places dashed green lines for planned shared use paths appear on top of other colored lines. Where dashed green lines appear on top of light blue lines, this indicates that a sidewalk of adequate width exists for basic pedestrian connectivity, and that a wider shared use path is also planned in the future. Such "sidewalk widening" improvements were ***not*** considered essential to provide multi-modal connectivity to transit for the purposes of this project, and as such were not listed as numbered improvements or included in any cost estimation of high-priority improvements. They are shown on the map figures for informational purposes only.

Other dashed green lines in the existing conditions and recommended improvements figures appear on top of red, orange, or light pink lines. On the existing condtions figures, dashed green over red indicates a gap where no current sidewalk or shared use path exists but a future local or regional shared use path is planned. On the recommended improvements figures, dashed green over red, orange, or light pink also indicates a gap (of the priority indicated by the non-green color) where no current sidewalk or shared use path exists but a future local or regional shared use path is planned. In these cases, 10'-wide shared use paths ***were*** considered essential as high-priority improvements (dashed green over red) to provide multi-modal connectivity to transit, and as such were listed as numbered improvements and included in the cost estimates that follow.

Some proposed shared use paths on surrounding streets and connecting to station platform areas are drawn from the City of Plano's 2018 Bicycle Transportation Map, while other proposed facilities are new recommendations made herein based on this study.

For crosswalk gaps, the type of improvement recommended is shown with numbered dark blue circles located near each crosswalk. The numbers in the blue circles correspond to the legend of possible pedestrian safety countermeasures appearing at the upper right of the figure. The first nine items in this legend correspond to the standard nine items in Table 1 of FHWA's publication, "Guide for Improving Pedestrian Safety at Uncontrolled Crossing Locations," referenced earlier in Section 2.6, Appendix C, and Appendix D. Treatments recommended somewhere on a particular figure have a red box around them in the legend for easier reference.

The right-hand side of each existing and recommended improvements figure includes a legend for "Primary Routes." These are street segments identified by NCTCOG as candidates for further evaluation during preliminary analyses that preceeded the subject project by the consultant team. Primary Routes are denoted with a darkened black street centerline and a letter designation matching a street name indicated in the legned. Comparing the primary routes with high priority gaps on the recommended improvements figures illustrates differences between the results of this preliminary methodology with the final methodology.

The "Half Mile Area Improvements Matrices" appearing in Appendix J for each station list for each improvement the owner, improvement type, location, length, notes, priority score, and (in the case of high priority improvements not built by others) the opinion of probable construction cost. A matrix for sidewalks and shared use paths appears first, followed by a second matrix for crosswalks sorted separately. Each of the matrices is sorted by ownership and then by ID number.

The notes discuss any observations from the field visits deemed relevant, as well as challenging conditions the City and other agencies may want to consider when advancing recommended projects to design and/or construction. This type of information captured in the notes was a primary component of developing the quantities that form the basis for the opinions of probable construction cost. Also included in the notes (where provided) is feedback received from the City about upcoming projects or development that may construct the improvement. The absence of a note indicates that the sidewalk improvement appears to be relatively straightforward without obvious challenges.

In some cases, ownership of or responsibility for improvements was assumed to be shared among agencies, such as for a sidewalk crossing the Plano/Richardson City boundary or for a crosswalk from DART property across an adjacent City street. Such mixed ownership cases appear at the end of each listing with separate OPCC subtotals. In these cases, the OPCC for individual improvements or groups of improvements was split equally among each agency in the summary tables that follow in the main body of the report.

Parker Road Station

Figure 1A-3 illustrates the existing conditions in the half-mile area around the Parker Road Station. Central Expy (U.S. 75), Parker Rd, Park Blvd, and K Ave are all arterials that provide barriers to multi-modal travel to and from the station. Due to a lack of collector streets east of the station, multi-modal travel to and from that direction is significantly more circuitous, though planned shared use paths will improve the situation.

Figure 1A-4 shows the recommended improvements in the half-mile area around the Parker Road Station. Note that a portion of the half-mile circle for Parker Road Station to the south overlaps with the half-mile circle for the Downtown Plano Station. Improvements for the overlapping area were considered together with the Downtown Plano Station area, as discussed in the following section.

As discussed in Section 3.2.1, a basic challenge for pedestrian and bicycle access to this station is the lack of direct connections to and from property to the east. Pedestrians are routinely observed jumping the low fence to reach the station platform from the bowling alley parking lot to the east.

A new Regional Veloweb shared use path had earlier been anticipated to connect to the east of the station on the north side of the Plano Super Bowl bowling alley, across K Ave at a pedestrian hybrid beacon, and along a creek greenway to the existing Santa Fe Trail, whose western terminus is about 2/3 mile east of the station platform. However, City of Plano staff indicated that the right-of-way easements for this shared use path had proven too difficult to obtain, and so it had been removed from the City's 2018 update to the Bicycle Transportation Plan.

Consequently, the consultant team replaced this earlier alignment with a new local shared use path (1A-PR-VW-V5 in Figure 1A-4) extending east from the south end of the station platform along the north side of property owned by the City of Plano. At its intersection with K Ave, a pedestrian hybrid beacon (1A-PR-CW-26) would facilitate crossing six lanes of high-speed traffic. While a dedicated sidewalk alignment would not continue farther east for direct access to the apartments east of Dobie Dr due to existing businesses between K Ave and Dobie Dr here, many apartment residents would still likely be able to traverse the business parking areas on foot.

Other more direct connections to areas northeast and southeast of the station would also be provided by constructing the north-south Regional Veloweb shared use path on the west side of the station platform, parallel to the tracks, shown as improvements 1A-PR-VW-V2 and 1A-PR-VW-V3 in Figure 1A-4.

A pedestrian hybrid beacon would serve multi-modal users crossing Parker Rd to the north of the station, while a traffic signal would accomplish the same purpose for crossing Park Blvd to the south. The pedestrian hybrid beacon (PHB, also known as a HAWK beacon) has the advantage of stopping traffic only for the duration necessary for pedestrians to clear a driver's travel lane, rather than requiring a stop for the whole duration of the walk and flashing don't walk intervals.

A traditional traffic signal was selected for the shared use path crosswalk across Park Blvd because drivers may confuse the flashing "wig-wag" sequence of the stop indication for the PHB with the stop indication for the light rail gate crossing. In any case, the pedestrian traffic signal or PHB at both crossings will require additional evaluation and coordination by the City of Plano, and should be coordinated with the train control system for the DART crossing to ensure minimized disruption to traffic.

Sidewalk improvements along U.S. 75 will allow more comfortable pedestrian access to and from the station for retail employees and customers who may not have access to a private vehicle.

Additional details about other improvements recommended in Figure 1A-4, as well as challenges associated with the recommended gaps to remain, are included in the matrix notes for Parker Road Station that can be found in Appendix J.

Downtown Plano Station

Figure 1B-3 illustrates the existing conditions in the half-mile area around the Downtown Plano Station. Downtown Plano is pedestrian friendly, with on-street parking and lower speeds along 15th St south of the station promoting easier crossings. Still, some improvements can be made along 15th St, including new or improved crosswalks. The one-way pair of K Ave and Municipal Ave also carries a higher speed and volume of traffic that presents somewhat of a barrier to multi-modal travel, as does 14th St two blocks south of the station, where transit-oriented development is occurring, with more expected in the future.

Figure 1B-4 shows the recommended improvements in the half-mile area around the Downtown Plano Station. Recommended improvements include new or improved crosswalks across 15th St at I Ave, at the proposed Regional Veloweb shared use path parallel to the DART tracks, and mid-block between J Ave and K Ave. Similarly, crossings across K Ave at 16th St, 15th Place and south of 15th St can provide improved safety.

A common need at many of these locations is advance "Yield Here to Pedestrians" signing and yield line striping (Item #3 in the "Possible Pedestrian Safety Countermeasures" legend). Located 20-50 feet in advance of a crosswalk (depending on approach speeds), the yield line and associated signs help mitigate the risk of the dual threat situation for pedestrians on multi-lane crosswalk approaches by providing adequate sight distance between the pedestrian and approaching traffic when a vehicle yielding too close to the crosswalk might otherwise obscure drivers' lines of sight.

City of Plano CIP project 6993 will construct improvement 1B-DP-CW-59 immediately south of the station where pedestrian ramps and a median cut-through are missing for a significant demand of bike and pedestrian travel between the station and apartments immediately to the southwest.

Sidewalk and crosswalk improvements 62 through 64 crossing and adjacent to the Plano Municipal Center would connect apartment complexes and single-family residential neighborhoods to the northeast more visibly and directly to the station.

The City of Plano indicated one location, a planned Regional Veloweb shared use path on the west side of the DART tracks between 15th St and 12th St, where there is not sufficient width for the shared use path shown on the City's Bicycle Master Plan. Rather than showing this link (1B-DP-VW-V02 and V03) as a gap to remain, the City directed it be retained in the project mapping as a placeholder for future planning efforts to find a feasible alignment. While the improvement was rated medium- to high-priority, no opinion of probable construction cost was provided owing to the actual infeasibility of the current alignment.

Crosswalks across 14th St at I Ave, at the future Regional Veloweb alignment described in the previous paragraph, and/or at J Ave are also recommended for better multi-modal access. A PHB is recommended at I Ave (#93 and #94), while a pedestrian traffic signal is recommended at the Veloweb crossing in close proximity to J Ave (#95 and #96).

In the southern part of the study area, the existing rail tracks parallel to 12th St will be the location of the future 12th Street Station on DART's Silver Line Project. The Silver Line will begin at DFW Airport on the west and stop at 10 stations, including CityLine Bush and 12th St before reaching a terminus at the future Shiloh Road Station one stop east of 12th St. Future service is anticipated to begin in 2022.

Many of the sidewalk and shared use path connections in and around the future 12th Street Station platform will be built or reconstructed in the near future as part of the Silver Line project. The future changes are currently under design, so they may not be reflected completely in Figure 1B-4. Consequently, several of the improvements are noted in the project matrices in Appendix J as being built by others. While these improvements would rightly be considered high-priority improvements in the context of walking and biking trips to the future 12th Street Station, the new station is not part of the funding grant for this project. Therefore, their relatively greater distance from the Downtown Plano Station results in their being scored primarily as low- and medium-priority improvements in Figure 1B-4.

Additional details about other improvements recommended in Figure 1B-4, as well as challenges associated with the recommended gaps to remain, are included in the matrix notes for Downtown Plano Station that can be found in Appendix J.

<u>CityLine Bush Station</u>

Figure 1C-3 illustrates the existing conditions in the half-mile area around the CityLine Bush Station. Central Expy (U.S. 75), the President George Bush Tpk (SH 190) and K Ave/N Plano Rd all pose boundaries to multi-modal access to the station. While the station is located just south of the Richardson City line formed by the PGBT, new transit-oriented residential development has occurred north of the PGBT in Plano, with other undeveloped parcels expected to bring more such development. The current configuration of the Park & Ride lots located below the PGBT bridge structures is oriented primarily to serve DART riders driving to the station, with fewer accomodations for pedestrian and bicycle trips through the large parking lots.

Figure 1C-4 shows the recommended improvements in the half-mile area around the CityLine Bush Station. Several sidewalks and connecting crosswalks should be built through and around the Park & Ride lots below the PGBT bridges. The high posted speed limits along the PGBT frontage roads create the need for high-visibility crosswalks. Therefore, pedestrian hybrid beacons are recommended at the Crawford Rd/Topridge Dr crossings of the PGBT frontage roads (1C-CB-CW-42, 43, and 59). Also, a pedestrian traffic signal is recommended for the crossings of the PGBT westbound frontage road just east and west of the DART tracks (1C-CB-CW-44 and 45). The existing crosswalk across the WBFR west of the tracks will be removed as part of the Silver Line Construction, which is still under design but will reconfigure other existing sidewalks and crosswalks in and around the station.

Three existing signalized intersections should receive pedestrian access improvements. Marked crosswalks and countdown, accessible pedestrian signals should be added at the intersections of Plano Pkwy with F Ave/Executive Dr and with K Ave. Though pedestrian indications are already present at the K Ave/N Plano Rd intersection with the PGBT frontage roads, sidewalks need to be added so that pedestrian travel through these intersections can occur during all weather and for DART riders of different abilities.

Additional details about other improvements recommended in Figure 1C-4, as well as challenges associated with the recommended gaps to remain, are included in the matrix notes for CityLine Bush Station that can be found in Appendix J.

ID	Owner	Improvement Type	Street Name	At/Between	Side of Street	Length (ft)	Notes	Priority Score	Opinion of Probable Cost
1B-DP-CW-46	City of Plano	New Crosswalk	18th St	I Ave	West	60	Add crosswalk signing, markings, and lighting. Implement road diet from four lanes to two to construct median refuge island for Veloweb crossing. Road diet recently implemented two blocks to the west to make curb bump-outs and on-street parking.	31	$ 60,300
1B-DP-CW-58	City of Plano	New Crosswalk	15th St	I Ave	East	60	Implement road diet to add median refuge island. Only one lane of westbound traffic with median island is present one block to east, so a similar cross section can be applied here. Add signs, markings, lighting, and pushbutton-activated RRFB's to highlight transition from 4 to 2 lane section. Add advance yield line and "Yield Here to Pedestrians" signs for eastbound direction only (2 lane approach).	28	$ 72,300
1B-DP-CW-59	City of Plano	New Crosswalk	E 15th St	DART Tracks	West	65	Add crosswalk & cut-through ramps at existing median island to provide accessible pedestrian refuge area. Add advance yield line and "Yield Here to Pedestrians" signs for eastbound direction only (2 lane approach). City of Plano reports construction of this segment as part of CIP project 6993.	46	N/A
1B-DP-CW-60	City of Plano	New Crosswalk	E 15th St	J Ave & K Ave	Midblock	60	Add pavement markings and pedestrian ramps to existing signed midblock crosswalk.	32	$ 21,200
1B-DP-CW-61	City of Plano	New Crosswalk	K Ave	15th Place	North	40	Provide advance yield line and "Yield Here to Pedestrians" signing upstream of this existing, unsignalized crosswalk.	35	$ 3,900
1B-DP-CW-63	City of Plano	New Crosswalk	Municipal Ave	L Ave	South	45	Add sidewalk west of Municipal Ave to connect to other sidewalk on Plano Municipal Center property. Advance and overhead pedestrian flashing lights already in place at Municipal Ave crossing. Add crosswalk markings, signing, and RRFB's at crosswalk location. Add sidewalk on south and west sides of L Ave on east side of Municipal Ave. Would provide more direct connection to station for apartments on northeast side of Municipal Ave. City of Plano reports that crosswalk improvements are in progress but that sidewalk improvements east of Municipal Ave are not included in this project.	43	N/A
1B-DP-CW-93	City of Plano	New Crosswalk	14th St	I Ave	West	60	Install crosswalk signing, markings, and lighting with pedestrian hybrid beacon. Evaluation and integration with other signals needed.	23	$ 96,200
1B-DP-CW-94	City of Plano	New Crosswalk	14th St	I Ave	East	65	Install crosswalk signing, markings, and lighting with pedestrian hybrid beacon. Evaluation and integration with other signals needed.	23	$ 95,500

1C-CB-VW-V04	DART	Shared Use Path	Regional Veloweb	President George Bush Hwy	N/A	285	City of Plano to coordinate this segment as part of Cotton Belt Trail.	41	N/A
1C-CB-VW-V05	DART	Shared Use Path	Regional Veloweb	E President George Bush Hwy & Cityline Dr	East	675	City of Richardson reports this segment is under design as part of the Plano Transit Village Veloweb project.	20	N/A
1C-CB-VW-V06	DART	Shared Use Path	Regional Veloweb	West Study Boundary & DART Tracks	N/A	3445	Veloweb trail to be built as part of Cotton Belt DART rail expansion.	37	N/A
1C-CB-VW-V07	DART	Shared Use Path	Regional Veloweb	W Cityline Dr & Hill St	West	310	Veloweb trail to be built as part of Cotton Belt DART rail expansion.	25	N/A
Opinion of Probable Cost - DART Subtotal									***$ 22,000***
1C-CB-SW-026	TxDOT	New Sidewalk	N Central Expy	North Study Boundary & WB On Ramp	West	1610	Some tree removal may be needed near north part of segment to provide adequate sidewalk offset from U.S. 75 frontage road. Short retaining walls may be needed to level ground for sidewalk in several places, particularly under flyover ramps to westbound PGBT.	17	N/A
1C-CB-SW-027	TxDOT	New Sidewalk	N Central Expy	North Study Boundary & Executive Dr	East	1095	Utility pole and low wall at north study boundary (right turn to Plano Pkwy) would need to be relocated to make room for sidewalk. Retaining walls and large guide sign relocation likely needed farther south.	27	$ 116,500
1C-CB-SW-028	TxDOT	New Sidewalk	N Central Expy	Executive Dr & N President George Bush Hwy	West	165		20	N/A
1C-CB-SW-030	TxDOT	New Sidewalk	N President George Bush Hwy	N Central Expy & Crawford Rd	North	705		24	$ 38,300
1C-CB-SW-036	TxDOT	New Sidewalk	N President George Bush Hwy	DART Tracks & J Pl	North	50		29	$ 5,000
1C-CB-SW-048	TxDOT	New Sidewalk	N President George Bush Hwy	N Central Expy & Crawford Rd	South	630		27	$ 39,100
1C-CB-SW-050	TxDOT	New Sidewalk	N President George Bush Hwy	Crawford Rd & DART Tracks	South	660		31	$ 40,000
1C-CB-SW-051	TxDOT	New Sidewalk	President George Bush Hwy WB Frontage Rd	DART Tracks & K Ave	South	825	New sidewalk on north side of DART parking lot would include crosswalk across U-turn lane at K Ave/N Plano Rd signal.	35	$ 201,400
1C-CB-SW-052	TxDOT	New Sidewalk	N President George Bush Hwy	DART Tracks & K Ave	North	760	Worn path in grass on this segment indicates existing pedestrian demand. City of Plano reports a portion of this segment is under construction with new development - see SP2018-001.	34	$ 48,100
1C-CB-GR-053	TxDOT	Gap to Remain	N President George Bush Hwy	K Ave	South	110	Crosswalks on inside legs of diamond interchange would not serve any demand between pedestrian generators and would interfere unnecessarily with vehicular traffic.	0	N/A
1C-CB-SW-054	TxDOT	New Sidewalk	N President George Bush Hwy	K Ave & East Study Boundary	North	1440		25	$ 78,600

Crosswalk Segments

ID	Owner	Improvement Type	Street Name	At/Between	Side of Street	Length (ft)	Notes	Priority Score	Opinion of Probable Cost
1C-CB-CW-011	City of Plano	New Crosswalk	E Plano Pkwy	Executive Dr	West	105	Provide marked crosswalks, pedestrian ramps, and countdown pedestrian signal heads. City of Plano reports this work is part of CIP project #7063.	26	N/A
1C-CB-CW-013	City of Plano	New Crosswalk	E Plano Pkwy	F Ave	East	105	Provide marked crosswalks, pedestrian ramps, and countdown pedestrian signal heads. City of Plano reports this work is part of CIP project #7063.	25	N/A
1C-CB-CW-014	City of Plano	New Crosswalk	F Ave	E Plano Pkwy	North	55	Provide marked crosswalks, pedestrian ramps, and countdown pedestrian signal heads. City of Plano reports this work is part of CIP project #7063.	19	N/A
1C-CB-CW-015	City of Plano	New Crosswalk	Executive Dr	E Plano Pkwy	South	50	Provide marked crosswalks and countdown pedestrian signal heads. City of Plano reports this work is part of CIP project #7063.	30	N/A
1C-CB-CW-017	City of Plano	New Crosswalk	E Plano Pkwy	DART Tracks	East	95	Need for crosswalk contingent on construction of Regional Veloweb shared use path. City of Plano reports this is being constructed as part of the Plano Transit Village Veloweb project. City is exploring a trail bridge alternative as part of the Cotton Belt project.	26	N/A
1C-CB-CW-024	City of Plano	New Crosswalk	E Plano Pkwy	K Ave	West	105	Provide marked crosswalks, pedestrian ramps, and countdown pedestrian signal heads.	17	N/A
1C-CB-CW-031	City of Plano	New Crosswalk	Executive Dr	Crawford Rd	West	60	Provide signed & marked crosswalk across Executive Dr with advance "Yield Here to Pedestrians" signing. Consider road diet for median refuge island.	30	$ 29,400
1C-CB-CW-033	City of Plano	New Crosswalk	Executive Dr	Crawford Rd	East	60	Provide signed & marked crosswalk across Executive Dr with advance "Yield Here to Pedestrians" signing. Consider road diet for median refuge island.	22	N/A
1C-CB-CW-039	City of Plano	New Crosswalk	K Ave	E Plano Pkwy	South	105	Provide marked crosswalks, pedestrian ramps, and countdown pedestrian signal heads.	23	$ 36,100
Opinion of Probable Cost - City of Plano Subtotal									***$ 65,500***
1C-CB-CW-092	City of Richardson	New Crosswalk	Cityline Dr	Wilshire Way	West	95	Ramps and median cut-through need to be built for crosswalk	18	N/A
Opinion of Probable Cost - City of Richardson Subtotal									***$ -***
1C-CB-CW-045	TxDOT	New Crosswalk	Routh West Dr	N President George Bush Hwy	East	90	Install traffic signal for future Veloweb crossing that has existing pedestrian demand. Add a traffic signal, signs, markings, and lighting. A pedestrian hybrid beacon (PHB) was considered for this location, but potential exists for confusion between flashing red lights associated with a PHB and the flashing red lights associated with the rail crossing at the DART tracks. Evaluation and integration with other signals needed. This improvement is under construction in conjunction with DART's Silver Line project.	35	N/A

Median Island Detailed Estimate - LOCATION 1B-DP-CW-46

(NOTES FROM WAP 2020-05-06)
This is similar +/- to similar location developed for 5A
copied and pasted from 05A OPCC for reference
will use same methodology and quantities and final cost
did not change anything from 05A

Assumptions
is across 8th Street on west side of Denley
assume 45 foot long
tear drop shape on west side - estimate as 2 triangles
assume max width at Denley is 10 foot

	ITEM NO	ITEM UNIT	QTY	UNIT COST	TOTAL
remove ex conc pavement (will equal new median area plus couple feet for C & G construction	0104 6001	SF	560	$0.49	$274.40
add median refuge island median pavment	356	SF	450	$6.00	$2,700.00
add conc roadway pavement thru refuge island space	454	SF	100	$6.33	$633.00
add conc curb across median refuge island	407	LF	20	$32.00	$640.00
add C & C along 8th street across median refuge length	407	LF	110	$32.00	$3,520.00
add striping east of Denley directing traffic to one lane each direction	0666 6035	LF	200	$0.84	$168.00
add striping west of tear drop to direct traffic around island approach	0666 6035	LF	200	$0.84	$168.00
add signs - west 1 on median, 2 advance signs to merge	0636 & 0646	EACH	3	$650.00	$1,950.00
add signs east of Hanley - heading WB 2 signs lane ends merge right	0636 & 0646	EACH	2	$650.00	$1,300.00
					$11,353.40

area of median - assume 2 triangles
0.5 x 45 x 10 x 2 = 450 sf

area of removal
add 45 lf x 2 sides plus 20 feet for median nose to median area
= 450 + [(45 x 2) + 20] = 560 SF

conc rdway pvmt at median refuge assume 10 ft wide x 10 ft long = 100 SF

Median Island Detailed Estimate - LOCATION 1B-DP-CW-58

Assumptions

	ITEM NO	ITEM UNIT	QTY	UNIT COST	TOTAL
existing median width 10 plus conc curb and gutter					
remove median pvmt	0104 6001	SF	140	$1.38	$193.20
remove conc C & G	0104 6022	LF	28	$7.62	$213.36
need to remove existing brick pavers and also reinstall along revised median configuration					
remove ex pavers	ASSUMED	SF	56	$5.00	$280.00
replace/reinstall brick pavers	ASSUMED	SF	56	$15.00	$840.00
for refuge along tracks remove 14 ft width to allow for construction of 10 wide refuge - 2 wheelchairs to pass					
installl 10 ft conc pavement	454	SF	120	$6.33	$759.60
install curb along road - each side	407	LF	16	$32.00	$512.00
install curb along median refuge	407	LF	20	$32.00	$640.00
remove ex median nose at west end to extend					
remove median pvmt	0104 6001	SF	50	$1.38	$69.00
remove C & G	0104 6022	LF	20	$7.62	$152.40
remove ex pavers	ASSUMED	SF	40	$5.00	$200.00
replace/reinstall brick pavers	ASSUMED	SF	30	$15.00	$450.00
install new conc median (leave opening to park drive on north side)					
measure on street view 135 lf					
assume width 10 ft to match existing width					
remove existing pavers	ASSUMED	SF	1890	$5.00	$9,450.00
replace/reinstall brick pavers	ASSUMED	SF	540	$15.00	$8,100.00
install concrete median pavement	350	SF	1350	$6.00	$8,100.00
install conc C & G	407	LF	600	$32.00	$19,200.00
remove existing signs (between I avenue and DART tracks)	807B	EACH	2	$223.00	$446.00
install new signs west of I Avenue	0636 &0646	EACH	3	$650.00	$1,950.00
add painted arrows on pavement west of I Ave for right turn only	0668 6019	EACH	2	$495.00	$990.00
					$52,545.56

Opinion of Probable Construction Cost

Median Island Detailed Estimate - LOCATION 1C-CB-CW-31

Assumptions

along Executive Drive, heading west from Crawford
assume 45 foot long
tear drop shape - will estimate as 2 triangles
asume max width at Crawford as 10 foot wide

	ITEM NO	ITEM UNIT	QTY	UNIT COST	TOTAL
remove existing conc pavement (will equal median area plus couple of feet for curb and gutter)	0104 6001	SF	560	$0.49	$274.40
add mediian refuge conc pvmt	356	SF	450	$6.00	$2,700.00
add conc curb across median refuge	407	LF	20	$32.00	$640.00
conc C & G along Executive	407	LF	110	$32.00	$3,520.00
add striping west of tear drop directing traffic around median refuge	0666 6035	LF	200	$0.84	$168.00
add signs for median - assume 2 and then one on median	0636 & 0646	EACH	2	$650.00	$1,300.00
					$8,602.40

area of median - assume 2 triangles
0.5 x 45 x 10 x 2 = 450 sf

area of removal
add 45 lf x 2 sides plus 20 feet for median nose to median area
= 450 + [(45 x 2) + 20] = 560 SF
