1. Introduction

One of the biggest challenges our nation's transit agencies face is finding a way to increase ridership in light of limited revenues. As is the case with many American cities, large portions of Dallas and its adjacent suburban areas have a relatively low population density level, which may make travel by transit a less viable option.

As an indication of these preferences, population density has been growing near transit stations along the Dallas Area Rapid Transit (DART) Blue and Red lines in the cities of Dallas, Garland, Plano, and Richardson. As ridership increases, the effects of existing gaps in infrastructure or barriers to pedestrian and bicycle accessibility at DART stations becomes more evident. These barriers have the potential to suppress the demand for rail traffic, increase motorized traffic to and from the rail stations, or increase safety risks for the roadway's most vulnerable users.

Coordination between transit agencies and city transportation offices is necessary in targeting first and last mile improvements that produce the greatest benefits while planning for anticipated costs. In support of these efforts, the North Central Texas Council of Governments (NCTCOG) initiated this study to verify exiting needs and to prioritize identified improvements for twenty-eight stations and their adjacent developed areas within the cities of Dallas, Garland, Plano, and Richardson.

1.1 Objectives

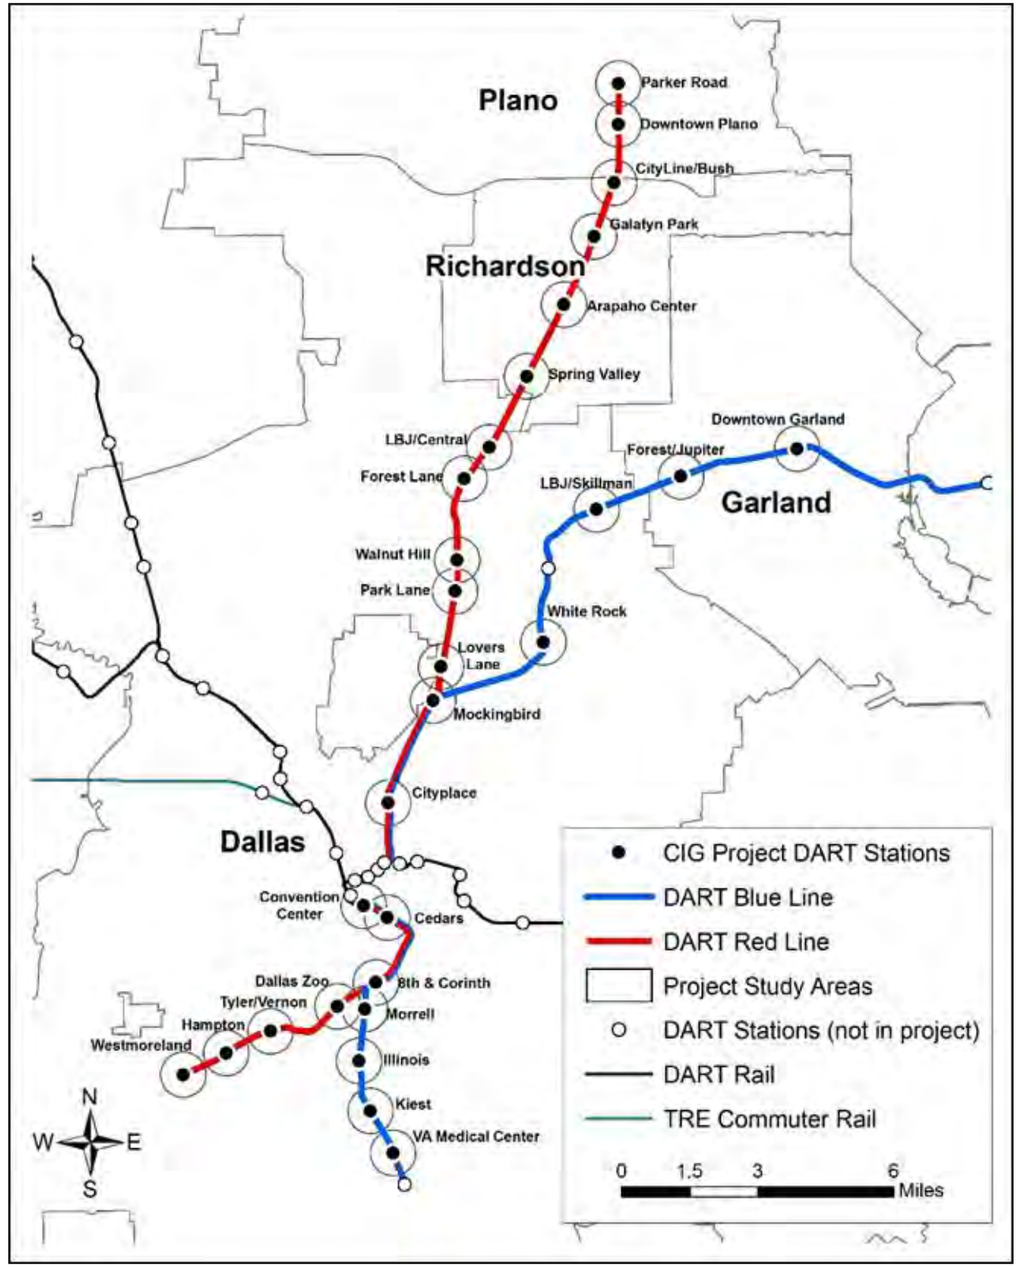
The project's objective is to provide opportunities for the greatest number of additional people to walk or bike to DART stations by identifying necessary sidewalk, shared use path, crosswalk connections, and related infrastructure within and surrounding the various DART stations. This was accomplished by:

- Conducting field investigation of existing pedestrian and bicycle infrastructure in the study area.
- Verifying the need for recommended pedestrian and bicycle improvements in priority corridors identified by NCTCOG to improve access and connectivity to light rail stations for the greatest number and density of residents and workers, thus increasing potential transit ridership.
- Identifying additional improvements based on field review, as necessary.
- Reviewing and updating NCTCOG's prior draft project prioritization of improvements based on information gathered during field review, engineering judgment, and criteria to be coordinated with City and DART staff stakeholders.
- Developing opinions of probable cost, and schematics for key pedestrian and bicycle improvements at rail stations and along prioritized routes to stations.

1.2 Study Area

The study area focused on the twenty-eight DART light rail stations built prior to 2004, included in the Red and Blue Line Platform Extension Project corridors, as shown in Figure 1.

Figure 1: Map of Study Area DART Stations



These stations are part of the Federal Transit Administration (FTA) Core Capacity Enhancement Capital Investment Grant, which made them eligible for FTA planning funds. Per FTA guidance, the one-half mile radius from the station is the effective planning area for transit-oriented development (TOD). These DART rail stations and their adjacent developed areas are located in the cities of Dallas, Garland, Plano, and Richardson.

While the intent of the planning work was to create corridor-level planning recommendations, not all areas surrounding all stations were reviewed using the same level of detail as part of this study; rather, strategic streets and sites within a broad selection of stations that were expected to be most cost effective were targeted for more thorough review.

1.3 Station Numbering & Report Organization

The system developed to organize improvements identified in the deliverables is illustrated in Figure 2. Each red or blue colored box in the figure represents a Red or Blue Line DART station respectively, arranged geographically from north to south. Purple boxes represent stations where the Red and Blue Lines run concurrently on the same alignment. Two-digit alpha-numeric codes assigned to each station are shown to the left of each box.

This report is organized for specific use by the City of Richardson. Other volumes of this report have been provided to other project stakeholders (NCTCOG, DART, Dallas, Garland, and Plano) which include similar details relevent to their jurisdictions. Figures common to all volumes of the report are numbered 1, 2, 3, etc. Figures specific to the City of Richardson have figure numbers beginning with the code (1C, 2A, 2B, or 2C) assigned to each station.

1.4 Station Area Half-Mile Boundaries

The CityLine Bush station is the only station half-mile area in the project that is divided by a City boundary. As such, information about this station is repeated in both the Plano and Richardson versions of the report.

The half-mile radii of some stations overlap. In most cases, the overlapping areas were divided equally between the two (or three) station areas for ease of reporting.

In the case of the small overlap between the Parker Road and Downtown Plano Stations, the entire overlap area was assigned to Downtown Plano. This was because, with the two stations being near the north end of the Red Line, it was determined that potential riders

Figure 2: Project Station Numbering Schematic

City	Station ID	Red Line	Station ID	Blue Line
Plano	1A	Parker Road		
	1B	Downtown Plano		
Richardson	1C	City Line/Bush		
	2A	Galatyn Park		
	2B	Arapaho Center		
	2C	Spring Valley		
Garland			3A	**Downtown Garland***
			3B	**Forest/Jupiter***
Dallas	3C	LBJ/Central		
	3D	Forest Lane		
	4A	Walnut Hill		
	4B	Park Lane	4E	LBJ/Skillman
	4C	**Lovers Lane***	4F	White Rock
	4D	Mockingbird		
	8A	Cityplace		
	8B	Convention Center		
	8C	Cedars		
	5A	8th & Corinth		
	5B	**Dallas Zoo***	5C	Morrell
	6A	Tyler Vernon	7A	Illinois
	6B	Hampton	7B	Kiest
	6C	Westmoreland	7C	VA Medical Center

*** Station with high priority improvements for 15% design**

in this area would be highly unlikely to walk north to the Parker Road Station only to then travel south.

2. Methodology

The consultant group conducted field investigations for each of the twenty-eight DART station properties and surrounding one-half mile areas within the study area to examine existing conditions of pedestrian and bicycle infrastructure and to determine potential improvements. Field visits for each station were made between July 2018 and January 2019. Specific dates are listed in Appendix A.

2.1 Field Survey (DART Station Properties)

The consultant group documented the existing pedestrian, bicycle, bus, and motor vehicle circulation and patterns, as well as the wayfinding, signage, and lighting at each station. Potential station-area improvements were then identified, including sidewalks, curb cuts, crosswalks, shared use paths, lighting and wayfinding, among others.

In many locations, signage for motorized and nonmotorized users needs to be updated in order to conform with the Manual on Uniform Traffic Control Devices (MUTCD).

Many pedestrian facilities were observed to be non-compliant with Americans with Disabilities Act (ADA) regulations. While a full inventory of all ADA infrastructure was outside the scope of this study, some example problems have been identified in the recommendations. It is recommended that DART conduct complete accessibility reviews to identify and correct all such concerns within DART station properties.

Review of the CityLine Bush Station was conducted while remaining cognizant of future connectivity to the DART Silver Line Commuter Rail (Cotton Belt) Project, currently in development.

2.2 Field Survey (Half-Mile Radii)

Inventories were developed of all proposed improvements within one-quarter mile of each station. Streets within one-quarter mile where existing sidewalks had been preliminarily identified as acceptable condition by NCTCOG were reviewed quickly by a combination of walking, biking, and/or driving. Within one-half mile of each station, the consultant team also reviewed corridors labeled as "Primary Routes" on NCTCOG's prior in-house mapping.

The primary focus of data collection efforts was information about major barriers to walking or biking to the stations. These included:

- Missing sidewalk links
- Unprotected crossings
- Multi-lane crossings
- Fences & landscaping
- Proximity to high-speed auto traffic

Map data from previous projects was reviewed revealing many locations where existing conditions had changed since NCTCOG's initial analysis. For example, recent sidewalk damage resulted in some additional gaps. Other gaps previously inventoried by NCTCOG had since been constructed by adjacent development or City/TxDOT projects.

2.3 Sidewalk Condition Classification

Existing sidewalk conditions were classified as acceptable or unaccaptable. As shown by the examples in Figure 3 on page 4, acceptable sidewalk was categorized as either "Excellent/Good" or "Fair." Unacceptable conditions included both "Poor" and "Nonexistent" sidewalk.

2.4 Incorporation of Other Data Sources

In some cases, additional improvements were constructed *after* the field work and were identified while conducting further review for prioritization on Google Maps aerial or Street View images. When such improvements were identified, the ArcGIS files were updated accordingly. However, other changes may have occurred between this review in Summer 2019 and the date of this report.

Information on several other sidewalk characteristics was compiled using Google Maps Street View in the office prior to the field visits and then verified by field personnel. For sidewalk segments, these characteristics included:

- Actual and effective sidewalk widths (accounting for obstructions such as utility poles)
- Type & width of buffer between sidewalk & street
- Presence & width of on-street parking, bike lanes & shoulder
- Presence of curb & gutter
- Posted speed limit
- Presence of lighting
- Number of adjacent travel lanes
- Adjacent land use category

The consultant team identified where sidewalk gaps are planned to be filled with shared use paths by reviewing NCTCOG's 2045 Regional Veloweb alignments adopted by the Regional Transportation Council. These were updated based on input from each city stakeholder about their most recent plans.

2.5 Identifying Crosswalks for Improvements

NCTCOG's prior in-house work identifying sidewalk gaps did not make any special considerations for crosswalks as distinct types of gaps in the pedestrian network. As part of this study, the consultants evaluated crosswalks at key locations, including:

- Existing signed and/or marked crosswalks crossing streets without signal or stop-sign control on the approaches being crossed.
- Unmarked/unsigned crossings of arterial or collector streets along radial lines to/from the station.
- Unmarked/unsigned crossings of arterial or collector streets not along radial lines to/from the station, but adjacent to significant pedestrian generators such as DART bus stops with significant levels of ridership, estimated by daily boarding and alighting data provided by DART.

Different types of field data were collected for signalized and unsignalized crosswalks during the field visits. At traffic signals, data collection included the number of lanes crossed in each direction, as well as the presence or absence of:

- Lighting
- Median refuge area
- Pedestrian ramps
- Countdown pedestrian signals
- Accessible pedestrian signals (APS)
- Pushbuttons (and if they were functional)

At unsignalized crosswalks, additional data collection items included:

- Whether the crosswalk had stop control for vehicular traffic or was uncontrolled.
- A two-minute count of traffic volumes crossing the crosswalk for locations where other daily traffic data from City or TxDOT sources was not available.
- Notes on any existing traffic control devices already present (such as signs, markings, or rectangular rapid flashing beacon (RRFB) assemblies.

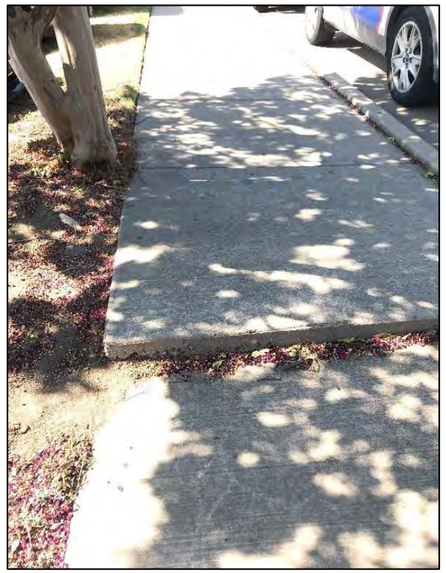
Each input for both sidewalk segments and crosswalks were considered later for use in evaluating and prioritizing improvements, though some data were ultimately not utilized in order to simplify the prioritization process. Data collection forms (including handwritten notes taken on maps and pre-filled tables) are found in Appendix B.

2.6 Crosswalk Improvement Selection

At existing or proposed crosswalks without existing stop sign or signal control, potential improvements were evaluated based on guidance in the Federal Highway Administration's (FHWA) recent publication, "Guide for Improving Pedestrian Safety at Uncontrolled Crossing Locations" (July 2018). This publication includes enhanced guidance on countermeasures that can or should be considered for uncontrolled crosswalks with various combinations of vehicular speed, traffic flow, and number of lanes to be crossed. A selection table reproduced from this publication and additional details about how the consultant team used it to develop crosswalk improvement recommendations are found in Appendix C.

Improvement options evaluated by this methodology include high visibility crosswalk markings, parking restrictions on the crosswalk approach, upgrading lighting, pedestrian crossing warning signs, "Advance Yield Here for Pedestrian" signs, curb extensions, median pedestrian refuge islands, rectangular rapid-flashing beacons (RRFB's), road diets, and pedestrian hybrid beacons. Road diets were only recommended if roadways would likely still have excess capacity after the lane reductions.

Figure 3: Sidewalk Condition Classification



Excellent/Good

- Functional for all users
- Meet all City & ADA standards (based on a superficial visual inspection only)

Fair

- May not be functional for some users, including those needing full ADA accessibility.
- Do not constitute gaps in the pedestrian network that would warrant replacement under funding programs designed to foster increased travel choices by walking and biking.
- May have moderate cracking & flaking with minimal uprooting or cracking.
- Minimal uplift by tree roots or other sources (estimated to be < 2" based on quick visual inspection)
- May warrant funding for accessibility upgrades under other programs designed specifically for that purpose or as part of cities' ADA Transition Plans
- Acceptable for the purposes of this project as being useful for a significant portion of the public who may be able to use them to travel to/from DART station.

Poor

- Poses potential hazards for all users.
- Severe cracking & flaking, with major uprooting & more significant trip hazards (vertical elevation differences > 2")
- Difficult to use by those pushing a wheelchair, cart, or stroller.
- Would require complete removal & replacement of at least one sidewalk panel.
- A few locations where steps had been consciously built into the sidewalk were also considered gaps.

Nonexistent

- Includes longer gaps of a City block or more
- Also some locations where individual panels were completely missing

- For vertical incongruities < 2", assumed that maintenance programs can make sidewalk passable to wheelchairs & strollers by providing asphalt wedges and/or grinding off corners < half depth of typical four-inch sidewalk slab.
- Since this project is targeting improvements that can be addressed by funding for new construction rather than maintenance funding, any trip hazards < 2" were assumed to be corrected by maintenance activities & therefore did not counts as gaps

A Microsoft Excel spreadsheet was created to automate the methodology and quickly produce a list of potentially recommended improvements given the inputs entered for each candidate crosswalk improvement location to be considered for the project. The analyst in each case still used engineering judgment to select which countermeasure options would ultimately be recommended. The inputs, options, recommendations, and notes are tabulated in tables found in Appendix D.

2.7 Stakeholder Involvement

Coordination meetings were conducted with all technical stakeholders including staff from the cities of Dallas, Plano, Garland, and Richardson, as well as staff from DART and NCTCOG to review the recommendations, and for information specific to their jurisdiction and background knowledge of study locations, as needed. Meetings with the public were not held as part of this work.

2.8 Half-Mile Area Improvement Prioritization – Initial Trial Method

To provide opportunities for the greatest number of additional people to walk or bike to DART stations by constructing sidewalk, shared use path, crosswalk connections, and related infrastructure, the prioritization of identified improvements was structured to provide balance between estimating this objective accurately and applying the methodology to a large study area.

Initially, a prioritization approach that attempted to track as closely as possible to potential ridership increases was tested for the Parker Road Station in Plano, with adjustments for safety, key destination access, and equity. Though some of the elements of this initial prioritization methodology were ultimately not included in this study, they are documented in Appendix E as being potentially useful for later studies on a smaller scale. Also, many of the assumptions and methodologies explained in Appendix E were retained in the ultimate methodology.

2.9 Half-Mile Area Improvement Prioritization – Final Methodology

The prioritization process used to score potential projects placed significant emphasis upon distance to/from the station and the number of (density) of persons on parcels that could be connected by constructing new infrastructure—the potential new riders who could access the DART station. The study did not attempt to correlate how many people would actually use DART if the walking and bicycling routes to the rail station were improved.

Figure 4: **Employment and Population "Tributary" to Sidewalk & Crosswalk Improvements**

Table 1 on page 6 identifies the criteria and weighting applied to rank potential projects. Additional details about the final methodology scoring process, including figures illustrating scoring for Plano's Parker Road Station, are provided in Appendix F. Highlights for each category and percent weight in the scoring system are as follows:

Tributary Employment & Population (50%): Each sidewalk and crosswalk improvement was scored based on the total employment plus population that would be "tributary" to the station via the improvement once all proposed improvements are constructed.

Figure 4 illustrates the concept of tributary employment and population. It shows the parcels in the Parker Road Station area, with darker shades of gray representing higher population/employment totals. Note that, while some of the improvements shown in Figure 4 differ from the final recommendations, the principles illustrated still apply.

In the figure, each sidewalk and crosswalk improvement link is shown in different colors depending on the total employment plus population that would be "tributary" to the station via the improvement once all proposed improvements are constructed. The tributary employment plus population values are shown next to each link, with red links nearest the station having the highest values.

Distance (25%): Each improvement was scored based on distance to the station, measured linearly "as the crow flies" for simplicity. Improvements that connect directly to the station have a distance of 0.0 miles.

Trip Length Reduction (5%): Each improvement was evaluated based on the percentage reduction in walking distance to the station that would occur for the population of a representative reference parcel.

Access (5%): Land uses with a high proportion of visitors to employees and locations near bus routes received priority in the scoring for this criterion.

Table 1: Weighting Criteria for Scoring Sidewalk and Crosswalk Improvements

Category	Tributary Employment & Population	Distance	Trip Length Reduction	Access		Safety		Equity
						Crash History	Systemic Safety	
Weight	**50%**	**25%**	**5%**	**5%**		**5%**	**5%**	**5%**
Inputs	Parcel population & jobs, GIS Network Analyst runs	Distance from Station	% Change in Pedestrian Trip Length	Other Nearby Destinations	Bus Routes	Number of nearby crashes in 5-year period	Posted Speed Limit	Environmental Justice Index
Description	Potential riders "upstream" of specific sidewalk or crosswalk improvements	Distance from individual improvements to station, measured "as the crow flies"	Measured for densest or farthest reference parcel tributary to each specific sidewalk or crosswalk improvement	Number of key destinations (hospitals, clinics, urgent care, schools, government buildings, courthouses, senior living, community centers, gardens, grocery stores, malls, supercenters, hotels, motels, entertainment, fine arts, parks, landmarks, athletic facilities, places of worship, libraries, museums, bus stops with > 25 daily boardings) within 250 feet of each improvement	Number of bus routes within 50 feet of each improvement that are also > 1/4 mile from station (Up to 3 points from bus routes but max. 5 points overall for key destinations and bus routes)	Number of crashes within 250 ft of improvement in 5-year period	Posted speed limit of parallel street or street being crossed	Designation of Above/Below Regional Average Percentage for Minority & Low-Income Populations
High Criteria/ Scoring Range	9,430 - 11,787 (20 to 25 points)	0 to 1/8 mile (25 to 19 points)	40-100% (5 points)	5+ destinations (5 points)	3+ routes (3 points)	5+ crashes (5 points)	≥ 45 mph (5 points)	Above Average for Both Minority and Low-Income (5 points)
Medium High Criteria/ Scoring Range	7,073 - 9,429 (15 to 20 points)	1/8 to 1/4 mile (18 to 13 points)	20-40% (3-4 points)	3-4 destinations (3-4 points)	2 routes (2 points)	3-4 crashes (3-4 points)	35-40 mph (3-4 points)	Above Average for Minority or Low-Income (3 points)
Medium Low Criteria/ Scoring Range	2,358 - 7,072 (5 to 15 points)	1/4 to 3/8 mile (12 to 6 points)	1-20% (1-2 points)	1-2 destinations (1-2 points)	1 route (1 point)	1-2 crashes (1-2 points)	25-30 mph (1-2 points)	
Low Criteria/ Scoring Range	0 - 2,357 (0 to 5 points)	3/8 to 1/2 mile (5 to 0 points)	0% (0 points)	No other destinations (0 points)	0 routes (0 points)	0 crashes (0 points)	≤ 20 mph (0 points)	Below Average for Minority and Low-Income (0 points)

Crash History (5%): A GIS shapefile was used containing the point location of all reported bicycle and pedestrian crash locations for the study area from 2013 to 2017. While the scope of this project did not include pedestrian volume data collection, the crash data was observed to serve as somewhat of a surrogate for pedestrian demand. Therefore, a cluster of crashes may be more indicative of a place where many people walk than of a place that's more dangerous to walk in terms of the risk to individual pedestrians.

Systemic Safety (5%): A more recent development in transportation safety that is designed to combat the drawbacks of traditional crash analysis is the concept of "systemic safety" which refers to approaches that are data driven and network-wide. This approach considered improvements at locations with similar characteristics to high crash locations, even if the locations where improvements are to be considered or proposed don't themselves have significant crash history.

As a measure of systemic safety, the project team opted to use the posted speed limit of the roadway adjacent to sidewalk improvements or crossed by crosswalk improvements. Vehicular speed is regarded as correlating well to safety outcomes in bicycle and pedestrian crashes.

Equity (5%): The equity criterion emphasized improving communities with populations that have not historically received equal access to resources. The consultants were provided spatial data for the project area with NCTCOG's Environmental Justice Index (EJI) to comply with federal rules for identifying Environmental Justice populations. The EJI is based on data from the 2013-2017 American Community Survey, aggregated at the census block level. Each census block is categorized if the percentage of its residents is higher than the regional average for minority population, low income, or both.

2.10 Gaps to Remain

The consulting team categorized some locations where gaps in the pedestrian network had been identified by NCTCOG during preliminary GIS work to be gaps to remain for the final project listing. This decision was based on field conditions that would be impractical or undesireable to implement or would make sidewalk construction extremely cost-prohibitive. Examples are detailed in Appendix F.

2.11 Improvement Numbering

Each proposed improvement, usually consisting of a single crosswalk or segment of sidewalk along a single city street block, was assigned a unique project-wide identification number for reference. The identification number consisted of:

- A two-digit code for the station area, matching the codes shown in Figure 2 earlier (For example, 1C for CityLine Bush, 2A for Galatyn Park, 2B for Arapaho Center and 2C for Spring Valley).
- A two-letter abbreviation for the station name for easier reference (For example, CB for CityLine Bush, GP for Galatyn Park, AC Arapaho Center and SV for Spring Valley).
- A two-letter code for the type of improvement (SW for sidewalk, CW for crosswalk, RP for repair, VW for Regional Veloweb, SP for shared use path, GP for gap to remain).
- A two- or three-digit number unique to identify the improvement location on project mapping. In addition to the VW improvement type code described in the bullet above, Regional Veloweb shared use path links have an improvement location number beginning with the letter V (V01, V02, etc.) to differentiate them from other improvements since they were numbered separately beginning at 1.

2.12 Prioritization Scoring

The consulting team evaluated each proposed improvement for the seven criteria described in Section 2.9 and Table 1. The proposed improvements were scored, and then sorted based the combined overall score. Possible total values ranged from 0-100 points. Additional details are included in Appendix F.

For each city (Dallas, Garland, Plano, and Richardson) separate scales were set for dividing improvements of varying scores into high, medium, and low-priority categories, but remained consistent for all stations within that city. The thresholds between high- and medium priority and medium- and low-priority were set such that approximately one-third of improvements for each city were allocated into each category. For half-mile areas surrounding DART rail stations in Richardson, the scoring ranges were as follows:

- High Priority = 22 to 100 points
- Medium Priority = 15 to 21 points
- Low Priority = 0 to 14 points

The City of Richardson after initial review of the results directed a number of changes in priority designation for individual improvements to depart from the above scoring ranges. The highest scoring improvement evaluated in Richardson was 2B-AC-SW-36, a segment of sidewalk along Central Expy southwest of the station between Collins Blvd and Arapaho Rd. This improvement received a score of 54 points.

3. Improvement Recommendations

The following sections include project mapping and opinions of probable construction costs for existing and proposed conditions, and improvements that have been identified to improve pedestrian and bicyclist access to the stations.

3.1 DART Station Property Recommendations & Opinions of Probable Construction Cost (OPCC)

The first figure in each set for individual station properties on pages 9, 12, 14 and 18 illustrates the station area including DART property limits, existing sidewalks, Regional Veloweb shared use paths and local shared use paths in and around each station.

The figures on pages 10-11, 15-17 and 19-20 show photographs of existing conditions at the same locations, referenced by matching, numbered orange stars. In many cases, the field photographs are enhanced with graphics to illustrate the proposed signing, pavement markings, or other traffic control devices that are recommended.

For each station, opinions of probable construction cost (OPCC's) were developed for each improvement, unless otherwise noted. The following cost components (totaling 25%) were applied to all costs, as directed and approved by both NCTCOG and DART:

- 10% design fee
- 4% mobilization
- 4% for landscaping allowance
- 2% for Erosion & Sediment Control Allowance
- 3% for traffic control
- 2% extra contingency for federal aid project

For additional details about the OPCC's, see Appendix G and Section 3.3 later in this report.

3.1.1 CityLine Bush Station (on DART Property)

Figure 1C-1.1 on page 9 identifies ten improvements recommended at CityLine Bush Station on DART property. Note that the station platform itself and all improvements located south of the President George Bush Tpk (PGBT) centerline are located in the City of Richardson, while all other improvements located north of the President George Bush Tpk (PGBT) centerline are located in the City of in Plano. Figures 1C-1.2 and 1C-1.3 on pages 10-11 illustrate existing conditions at the ten improvement locations. Several of the improvements discussed are at the boundary of DART's right-of-way and would therefore require coordination between DART, TxDOT, NTTA and/or the Cities of Plano and Richardson. (TxDOT maintains the PGBT frontage roads as SH 190). These improvements are also discussed in the figures and tables associated with Section 3.2 of this report (page 21) detailing off-station improvements.

The recommended improvements include:

- Constructing enhanced crosswalks for crossing the PGBT westbound frontage road at Crawford Rd/Topridge Dr and just east of the DART track crossing. See items 3a and 8 in Figure 1C-1.1. Enhanced conspicuity for crossing pedestrians and bicyclists is needed due to the high speeds permitted on the frontage roads and the large apartment complexes recently constructed on the north side of the PGBT. The crossing east of the DART tracks is being constructed as part of the Cotton Belt Trail construction.
- Providing short, more direct sidewalk paths connecting to adjacent private property to follow observed worn paths in the grass indicating existing pedestrian demand. See items 3 and 6 in Figure 1C-1.1. Coordination with adjacent property owners would be required.
- Adding and improving ADA ramps for better wheelchair access on the station platform.
- Adding pedestrian warning signs at crosswalks to the station platform.

Refer to the figures for additional details.

DART's Silver Line project will provide future commuter rail service beginning in late 2022 between DFW Airport and the new Shiloh Road Station east of the CityLine Bush Station. Many of the sidewalk connections in and around the existing CityLine Bush Station platform, including the last two items in the bulleted list above, will be reconstructed in the near future as part of the Silver Line project.

The total OPCC for the DART improvements in Richardson is approximately $83,000. This excludes costs for improvements 1C-CB-ST-07 and 1C-CB-ST-10, which are located in the City of Plano and/or will be constructed as part of the Silver Line Project.

Improvements 1C-CB-ST-08 and 1C-CB-ST-09 were integral to the half-mile area analysis undertaken in Section 3.2 and are therfore quantified together with off-site improvements as shared costs between DART, the City of Plano, and the City of Richardson. Only the portion of the cost assumed to be DART's responsibility is included here. Tables listing the estimated costs for individual improvements, as well as line item calculations, are included in Appendix H.

3.1.2 Galatyn Park Station (on DART Property)

Figure 2A-1.1 on page 12 identifies one improvement recommended at the Galatyn Park Station on DART property, as well as existing conditions at the improvement location.

A new sidewalk connecting the existing Central Trail on the south end of the DART train platform is needed. This connection is already planned and funded under DART's ongoing Red and Blue Line Platform Extension Project. Refer to the figure for additional details. There is no estimated cost for this improvement since it is already included in a funded project.

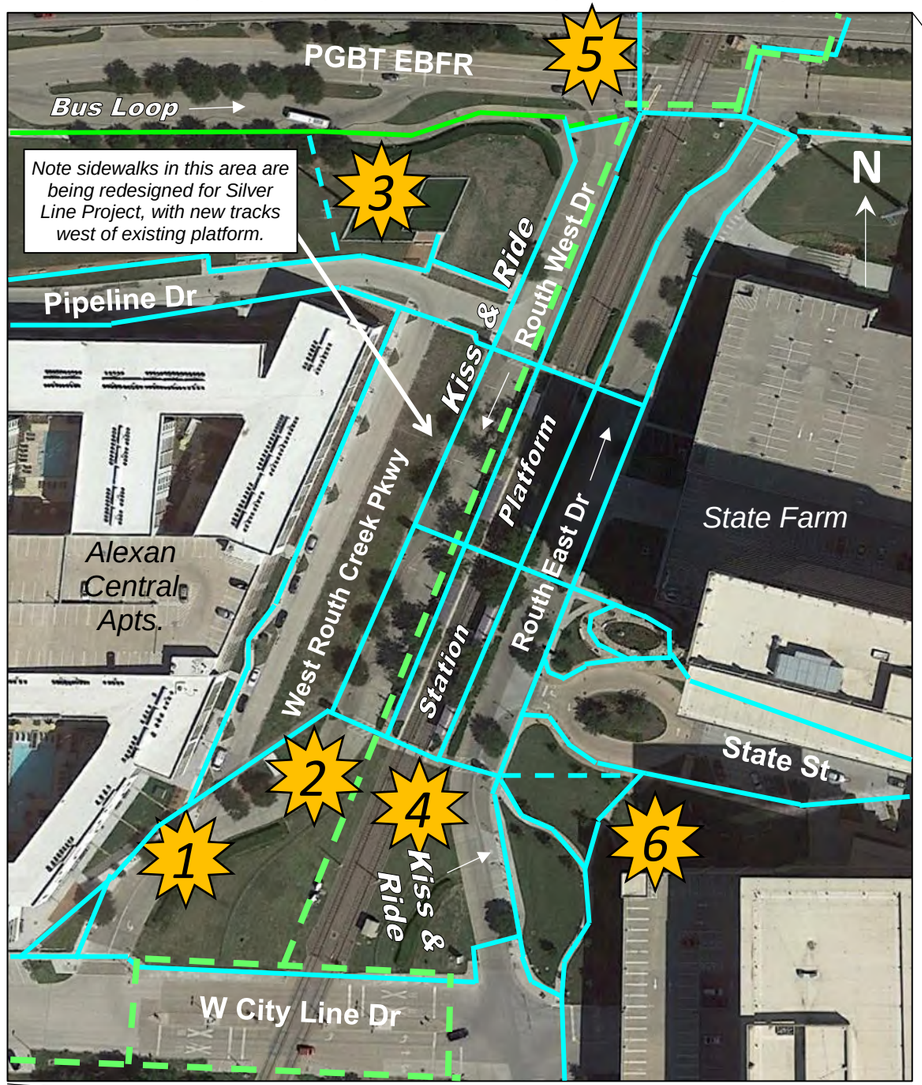
CityLine/Bush Station Recommended Access Improvements

Total for All Recommendations at Station: **$152,600 (=$69,600 in Plano + $83,000 in Richardson)**

North Central Texas Council of Governments

DART Red & Blue Line Corridors Last Mile Connections

Number	Description
1	The Dallas tourism "BiG" sign on Routh West Dr just south of the station should be reversed to face the opposite direction or the sign should be relocated to a safer position. The sign faces the street, a poor orientation since those taking photographs of others posing at the sign will be tempted to stand in the travel lanes.
2	Widen the ADA ramp to Routh West Dr from the south end of the platform to allow wheelchair users to bypass the large vine sculpture blocking the top of the ramp.
3	Coordinate with adjacent property owner to add a direct sidewalk connection between train platform & bus loop. A worn path in the grass ("goat trail") exists between the southwest corner of the Alexan Central Apartments dog park on Pipeline Dr and the DART bus stops along the PGBT eastbound frontage road. This is the most direct route between the train station platform and the bus stops, shorter than walking north along Routh West Dr and the frontage road. See improvement 1C-CB-SW-071.
4	Add pedestrian warning signs on the right-hand side of the roadway at the six crosswalks to the station platform across Routh East Dr and Routh West Dr. Existing signs are mounted on the left-hand side only. Add missing ADA ramps at two of the same locations.
5	Repair the sidewalk panel where settlement has created a trip hazard near the pedestrian pushbutton on the north side of the President George Bush Turnpike (PGBT) eastbound frontage road at Routh West Dr.



NOT TO SCALE

Number	Description
6	Coordinate with the adjacent property owner to construct a short segment of sidewalk for more direct travel between the southern crosswalk to the train platform and the south sidewalk along State St. A "goat trail" cuts the corner where the existing sidewalk is offset from the crosswalk, indicating existing pedestrian demand.

Legend

Sidewalk/Crosswalk

Existing

Proposed

Regional Veloweb

Existing

Proposed

Number	Description
7	Construct a new, short segment of sidewalk on the west side of the Crawford Rd/Topridge Dr crossing under the PGBT, near the north end of the underpass adjacent to the PGBT westbound frontage road (WBFR). Add marked, signed crosswalks across both legs of the WBFR. The existing sidewalk on the west side extends north from the EBFR but ends just south of the WBFR. Provide pedestrian hybrid beacon with advance "Yield Here to Pedestrians" signing for crossing PGBT westbound frontage road. See also half-mile area improvements 1C-CB-CW-042 and 1C-CB-CW-043 for more information.
8	Add sidewalk on east side of Crawford Rd/Topridge Rd between PGBT frontage roads. See also improvement 1C-CB-CW-056 in the half-mile improvements map & matrix.
9	Add a crosswalk across the east leg of the PGBT Eastbound Frontage Road (EBFR) at Topridge Dr. Provide pedestrian hybrid beacon with advance "Yield Here to Pedestrians" signing. See also half-mile area improvement 1C-CB-CW-059.
10	Construct a crosswalk across the PGBT WBFR just east of the track crossing. Also, consider adding a traffic signal here similar to the existing signal on the PGBT EBFR, with care taken to coordinate with the adjacent railroad crossing gates. A crosswalk west of the tracks that will be removed with the Silver Line construction currently has only pedestrian warning signs and ramps. These changes will provide safer access to the DART station for residents of apartments on the north side of the westbound frontage road. See half-mile area improvement 1C-CB-CW-045 for more information.
General	Many pedestrian ramps in the station area are missing detectable warning surfaces, which should be added.

LEE ENGINEERING 30 YEARS OF EXCELLENCE

3.1.3 Arapaho Center Station (on DART Property)

Figure 2B-1.1 on page 14 identifies thirteen improvements recommended at Arapaho Center Station on DART property. Figures 2B-1.2 through 2B-1.4 on pages 15-17 illustrate existing conditions at the thirteen improvement locations.

A worn path in the landscaping between the west end of the bus loop and the pedestrian tunnel indicates existing demand for more convenient movement improvement 2B-AC-ST-09). A direct path and new crosswalks are recommended, along with consolidating the existing bus stops to make space.

The existing pedestrian ramps to the station platform on the west side of the deep tunnel under Greenville Ave (location 10a) have too long of an uninterrupted grade for people using manual wheelchairs. DART should coordinate with the City of Richardson to revise the recent addition of an at-grade crosswalk across Greenville Ave to include an accessible path to the station on the west side to bypass or replace the recently-built stairs (location 10b).

The under-utilized parking lot on the east side of the site should be developed as a Transit-Oriented Development (TOD), consistent with recent City of Richardson Innovation Quarter Plan. DART and the City of Richardson are considering moving the Kiss & Ride and Bus Loops to the west side of Greenville Ave as part of the station redevelopment.

Other recommended improvements include:

- Building new sidewalk connecting the train platform to the U.S. 75 northbound frontage road, including new safety fence between the sidewalk and the tracks (improvement 2B-AC-ST-13).
- Updating or relocating signs to meet MUTCD standards and adding or refreshing crosswalk striping.
- Installing pedestrian lighting for areas where tree cover makes for dark nighttime conditions (improvements 2B-AC-ST-04 and 2B-AC-ST-05).
- Relocating existing bike parking located far from the train platform (location 2a) to the locations near the station (location 2c). A few parking spaces may need to be removed.

Refer to the figures for additional details. The total OPCC for the DART improvements is approximately $170,000. Tables listing the estimated costs for individual improvements, as well as line item calculations, are included in Appendix H.

3.1.4 Spring Valley Station (on DART Property)

Figure 2C-1.1 on page 18 identifies nine improvements recommended at Spring Valley Station on DART property. Figures 2C-1.2 through 2C-1.3 on pages 19-20 illustrate existing conditions at the nine improvement locations.

Some pedestrians were observed crossing Spring Valley Rd, a busy six-lane arterial, directly below the rail overpass instead of at the adjacent signalized crosswalks at Lingco Dr to the west or Spring Valley Rd to the east. DART should coordinate with the City of Richardson to consider installing anti-climb median fencing (improvement 2C-SV-ST-9) along the median of Spring Valley Rd in front of the DART station to ensure pedestrians cross at the crosswalks.

DART should also coordinate relocation of the bus stop on Lingco Dr to the downstream side of the crosswalk between the station platform and the Park & Ride lot (improvement 2C-SV-ST-2). The current location of the bus stop upstream of the crosswalk creates unnecessary potential for visibility obstructions between bus drivers and crossing pedestrians.

Other recommended improvements include:

- Installing pedestrian lighting for an area where tree cover makes for dark nighttime conditions (improvement 2C-SV-ST-6).
- Updating or relocating signs to meet MUTCD standards.
- Fixing pedestrian trip hazards.

Refer to the figures for additional details. The total OPCC for the DART improvements is approximately $240,000. Tables listing the estimated costs for individual improvements, as well as line item calculations, are included in Appendix H.

Arapaho Center Station Recommended Access Improvements

North Central Texas Council of Governments

DART Red & Blue Line Corridors Last Mile Connections

Number	Description
1	Change the arrow direction of "PEDESTRIANS USE UNDERPASS" sign to pointing "through" instead of pointing to the left.
2a-2c	Move the existing bike parking that is located far from the train platform (location 2a) to the corner of the lot near the station and the grassy area between the fence for the tracks and the trail south of the platform (location 2c). A few parking spaces may need to be removed. Bikes chained on the fence near the ticket machine (location 2b) are evidence of demand for more conveniently located bike parking.
3	Redevelop the under-utilized parking lot on the east side of the site as a Transit-Oriented Development (TOD), consistent with recent City of Richardson Innovation Quarter Plan. The City of Richardson and DART are also considering moving the Kiss & Ride and Bus Loops to the west side of Greenville Ave as part of the station redevelopment.
4-5	Add pedestrian lighting for area where tree cover makes for dark nighttime conditions.
6	Update "DO NOT ENTER" signs to meet MUTCD standards. Increase the size of STOP SIGN to obscure the shape of signs mounted on the other side.
7-8	Add crosswalk striping parallel to and on either side of the decorative brick crosswalks to make them high-visibility crosswalks and to properly define them as legal crosswalks where pedestrians have the right-of-way.
9	Create a more direct path between west end of bus loop and pedestrian tunnel to encourage its use. Worn path in landscaping here shows pedestrian desire line. Build new crosswalk across bus loop and stairs down to pedestrian tunnel path (longer path already exists for ADA compliance). Consolidate existing bus stops along the bus loop if necessary to make space for crosswalk.
10	The existing pedestrian ramp from the tunnel under Greenville Avenue to the station platform (location 10a) has too long of an uninterrupted grade for people using manual wheelchairs. Since level platform breaks for resting locations would require lengthening the ramp and necessitate extensive additional excavation, the City of Richardson and DART are instead planning to revise the recent addition of an at-grade crosswalk across Greenville Ave to include an accessible path to the station on the west side to bypass or replace the recently-built stairs (location 10b).
11	Replace the existing "Rail Station Access" sign with a fence-mounted sign with an arrow pointing diagonally down and reading "Pedestrians Use Tunnel." (The existing sign appears to direct pedestrians to jump the fence).
12	Update the "PEDESTRIANS USE UNDERPASS" sign to make the arrow a "U-Turn" instead of pointing to the left.
13	Build sidewalk connecting train platform to U.S. 75 frontage road. Pedestrian safety fencing will need to be installed between the new sidewalk and tracks. See half-mile area improvements 2B-AC-SW-037 for more details.

3.2 Half-Mile Area Recommendations

Figure 1C-2, Figure 2A-2, Figure 2B-2 and Figure 2C-2 on pages 22, 24 and 26-27 identify recommended high, medium- and low-priority improvements as separate construction packages for each station's half-mile area in Richardson. These figures are collectively referred to as phasing maps. High-priority improvements should be considered for Phase 1 of construction at each station. As funding is available the medium and low-priority improvements should be implemented either with the Phase 1 improvements or as part of future phases.

The legend for each map includes a brief summary of opinions of probable construction cost for each phase and station, which are described in greater detail in Section 3.3.

For additional context, Appendix I contains detailed maps of the recommendations for each station's half-mile area, including existing, planned, and funded regional and local shared use paths, as well as existing, planned and funded on-street bicycle networks.

In each phasing map, existing sidewalks are shown in light blue. The density of individual parcels' population plus employment are shown in grayscale, with darker colors representing higher values.

Proposed sidewalk and crosswalk improvements are shown in multiple colors, according to the assigned priority: red for high-priority (Phase 1), orange for medium-priority (Phase 2), and light pink for low-priority (Phase 3). Gaps to remain are shown in dark pink. For more details about these categories, refer to Appendix F.

Each high- medium- and low-priority improvement, along with all gaps to remain, are indicated by the boxed number labels near each improvement location. The lower right corner of each phasing map includes a legend that describes the abbreviations in the improvement ID codes, which can be used to cross-reference the improvement matrices that appear in Appendix J.

For solid red, orange, or light pink lines, the recommended improvement for a sidewalk gap is either a new or repaired 5-foot wide sidewalk or a new 10-foot shared use path along the length shown. Repairs are noted in the matrix notes for each improvement in Appendix J, and assume full removal of damaged, existing sidewalk prior to replacement.

For crosswalk gaps, the type of improvement recommended is shown with numbered circles located near each crosswalk. The numbers in the circles correspond to the legend of possible pedestrian safety countermeasures appearing at the upper right of the figure. More details about these improvements can be found in Section 2.6, as well as in Appendix C, Appendix D, and Appendix J. Treatments recommended somewhere on the phasing maps have a red box around them in the legend for easier reference.

The "Half Mile Area Improvements Matrices" appearing in Appendix J for each station list for each improvement the owner, improvement type, location, length, notes, priority score, and (in the case of high priority improvements not built by others) the opinion of probable construction cost. Additional information useful for interpreting the tables in Appendix J may be found in Appendix I.

3.2.1 CityLine Bush Station (Half-Mile Area)

Figure 1C-2 on page 22 shows the recommended improvements in the half-mile area around the Cityline Bush Station. Central Expy (U.S. 75), the President George Bush Tpk (SH 190) and K Ave/N Plano Rd all pose boundaries to multi-modal access to the station. While the station is located just south of the Richardson City line formed by the PGBT, new transit-oriented residential development has occurred north of the PGBT in Plano, with other undeveloped parcels expected to bring more such development. The current configuration of the Park & Ride lots located below the PGBT bridge structures is oriented primarily to serve DART riders driving to the station, with fewer accomodations for pedestrian and bicycle trips through the large parking lots.

Several sidewalks and connecting crosswalks should be built through and around the Park & Ride lots below the PGBT bridges. The high posted speed limits along the PGBT frontage roads create the need for high-visibility crosswalks. Therefore, pedestrian hybrid beacons are recommended at the Crawford Rd/Topridge Dr crossings of the PGBT frontage roads (1C-CB-CW-42, 1C-CB-CW-43, and 1C-CB-CW-59). Also, a pedestrian traffic signal is recommended for the crossing of the PGBT westbound frontage road just east of the DART tracks (1C-CB-CW-45). The existing crosswalk across the WBFR west of the tracks will be removed as part of the Silver Line Construction, which is still under design but will reconfigure other existing sidewalks and crosswalks in and around the station.

Three existing signalized intersections should receive pedestrian access improvements. Marked crosswalks and countdown, accessible pedestrian signals should be added at the intersections of Plano Pkwy with F Ave/Executive Dr and with K Ave. Though pedestrian indications are already present at the K Ave/N Plano Rd intersection with the PGBT frontage roads, sidewalks (1C-CB-SW-046, 1C-CB-SW-047, and 1C-CB-SW-061) need to be added so that pedestrian travel through these intersections can occur during all weather and for DART riders of different abilities.

Most of the recommended improvements south of the station in Richardson are anticipated for construction by others, either as part of the Silver Line project, the ongoing development of CityLine, or other projects by the City of Richardson.

Additional details about other improvements recommended in Figure 1C-2, as well as challenges associated with the recommended gaps to remain, are included in the expanded narrative and matrix notes for Cityline Bush Station that can be found in Appendix I and Appendix J.

3.2.2 Galatyn Park Station (Half-Mile Area)

Figure 2A-2 on page 24 identifies the recommended improvements in the half-mile area around the Galatyn Park Station. Central Expy (U.S. 75) currently blocks all bicycle and pedestrian travel to and from the west since the only bridge that crosses it within the half-mile area, on Galatyn Pkwy, does not include sidewalk. A DART shuttle (Route 824) connects the station to areas west of U.S. 75 at 15- to 20-minute intervals during weekday peak hours.

The City of Richardson should consider improved bicycle and pedestrian access across U.S. 75. Many pedestrians and cyclists would likely prefer the increased convenience of a sidewalk connection over the 15- to 20-minute intervals provided by DART Bus Route 824. A sidewalk connection would also be available at mid-day, night or on weekends.

The Galatyn Pkwy bridge would either need to be widened to provide sidewalk, or a road diet would need to be implemented. Narrowing lanes from 11 feet wide to 10 feet wide could provide space for a minimal 4-ft wide sidewalk on one side of the bridge only.

A better alternative for a road diet may be to reconsider the lane geometry of the tight-diamond interchange. Northbound and southbound vehicular through movements from the ramps are unnecessary and can be eliminated. The interchange could then potentially be converted to a diverging diamond interchange (DDI) configuration with a single lane in each of the eastbound and westbound directions.

This configuration would require a median, but sidewalk could then be provided either along one side of the bridge or (as is relatively common in the DDI configuration) in the median between opposing lanes, each traveling in a counterflow direction. Drainage, lane striping, and signal phasing changes would also be neeed on the bridge approaches and ramp intersections.

Geometric and capacity studies would be needed to validate the concept, incorporating projected future conditions with build-out of adjacent developments. However, the concept holds potential since DDI's frequently outperform traditional tight diamond interchanges by a large margin and/or with fewer lanes.

In addition to the bridge improvement and new sidewalk in some locations to fill network gaps, other recommended improvements include:

- New crosswalks with rectangular rapid-flashing beacons (RRFB's) for crossing Glenville Dr at two locations (improvement 2A-GP-CW-67 and 68) across a long stretch where the street has no other controlled crossings. The northern location would connect existing sidewalk from the station to the Infosys corporate campus, but would require coordination with the private property owner to extend sidewalk to the building front doors.
- Marked crosswalks, pedestrian ramps, pedestrian warning signs, yield lines, advanced yield signing and/or crosswalk lighting for several locations along N Collins Blvd, E Lookout Dr and Lakeside Blvd (improvements 2A-GP-CW-08-09, 12-13, 58, 80 and 83). In several of these locations, white crosswalk lines are required parallel to existing brick crosswalks to establish a visible and legally enforceable crosswalk.
- Marked, signed, and lit crosswalks across Palisades Blvd at South Gate Dr (improvements 2A-GP-CW-26 and 27). Consider curb extensions or a median refuge island in the wide 34-ft roadway. Care should be taken to provide advance warning signs in the eastbound direction due to the crest vertical curve in the roadway to the west. Or, the potential also exists for revising traffic signage to make the north-south route primary. In addition, the Palisades master plan does include the possibility of Palisades Blvd abandonment east of Empire Dr.
- White edge lines on the outside of brick crosswalks at the roundabout entries and exits where Lakeside Blvd intersects Lawnview Dr (improvements 2A-GP-CW-81, 82 and 85). Also, the only way to reach the roundabout crosswalks from adjacent sidewalks is via stairs to/from the sidewalks above. Explore alternatives for ADA-compliant access, and add pedestrian ramps at each crosswalk.

Many missing sidewalks will be constructed by the Palisades development as it is completed just west of Central Expy and the station. The developer will bear the cost for these improvements.

Additional details about other improvements recommended in Figure 2A-2, as well as challenges associated with the recommended gaps to remain, are included in the expanded narrative and matrix notes for Galatyn Park Station that can be found in Appendix I and Appendix J.

3.2.3 Arapaho Center Station (Half-Mile Area)

Figure 2B-2 on page 26 identifies the recommended improvements in the half-mile area around the Arapaho Center Station. Central Expy (U.S. 75), Collins Blvd, and Arapaho Rd are all arterials that provide barriers to multi-modal travel to and from the station.

Coordination between the City, DART, and adjacent private property owners would be required to construct a sidewalk connection southwest of the train platform to connect more directly to the U.S. 75 northbound frontage road and the businesses located there (improvement 2B-AC-SW-37). Also highly recommended is the construction of sidewalk fronting several of those businesses farther south (improvement 2B-AC-SW-37).

A shared use pathway as part of the Regional Veloweb network is planned along the Kansas City Southern rail line entering the north part of the study area and connecting to Collins Blvd west of U.S. 75 (improvement 2B-AC-VW-V01). A sidewalk connecting this improvement and the existing sidewalk along the west side of Collins Blvd to the sidewalk along the U.S. 75 southbound frontage road should be constructed as well (improvement 2B-AC-SW-03).

The City of Richardson plans to implement a road diet on the Collins Blvd bridge that will allow for wider sidewalks and protected bike lanes. The project should include signed and marked crosswalks with pedestrian-actuated rectangular rapid-flashing beacons (RRFB's) for crossing each of the four ramps between Collins Blvd and the U.S. 75 frontage roads, since the geometry of these ramps is conducive to high vehicular speeds.

Two new crosswalks are recommended for crossing Richardson Dr. One is recommended south of Monte Blaine Ln (improvement 2B-AC-CW-55), where the existing sidewalk on the west side ends, so the crosswalk will provide an alternate route via new and proposed sidewalk on the west side. The other crosswalk location (improvement 2B-AC-CW-53) aligns with an existing break in the hedges that aligns with the east end of Jolee St.

Both crosswalks must be designed carefully to maximize sight distance around the hedges and the tree-lined horizontal curves in the roadway geometry. Both should include yield lines and "Yield Here to Pedestrians" signing in each direction to mitigate risk of dual threat situation for pedestrians. Give strong consideration to installing pedestrian-actuated rectangular rapid flashing beacons (RRFB's), particularly due to the sight distance limitations. A road diet to introduce curb extensions and/or a median refuge island for pedestrians might also be considered to increase available pedestrian sight distance.

Additional details about other improvements recommended in Figure 2B-2, as well as challenges associated with the recommended gaps to remain, are included in the expanded narrative and matrix notes for Arapaho Center Station that can be found in Appendix I and Appendix J.

3.2.4 Spring Valley Station (Half-Mile Area)

Figure 2C-2 on page 27 identifies the recommended improvements in the half-mile area around the Spring Valley Station. U.S. 75, Spring Valley Rd, and Centennial Blvd are major arterials that pose barriers to bicycle and pedestrian travel, though signalized crossings generally provide good access opportunities. Access to the transit-oriented development east of the station is good with new sidewalk, though somewhat indirect. Several gaps in the sidewalk are present along the U.S. 75 frontage roads and along the neighborhood streets east of Greenville Ave.

In addition to building sidewalk to fill gaps in the network, the recommended improvements include:

- At the west end of McKamy Springs Ct, consider providing short break in the existing fence to provide a sidewalk connection to the Central Trail. This would provide a shorter walking distance to the station for many apartment and townhome residents to the east. The City of Richardson indicates they will need to work with the property owner on whether they have a desire for this improvement.

- New or improved crosswalks across Lingco Dr between the station platform and park & ride lot, across Sherman St at Lingco Dr, and across Greenville Ave at Pittman St (improvements 2C-SV-CW-16, 17 and 38). Yield lines and signing, and a pedestrian refuge island are recommended at the Lingco Dr and Greenville Ave crossings, while pedestrian-actuauted RRFB's are recommended at Lingco Dr. The Lingco Dr crossing should be coordinated with DART, as discussed in Section 3.1.4.

- New yield lines and signing for the two lanes in each direction approaching the existing signed and marked crosswalk across Greenville Ave at E Phillips St, near the northeast half-mile area boundary (improvements 2C-SV-CW-30 and 31). Consider adding a pedestrian hybrid beacon if warranted by a study of pedestrian volumes during arrival and dismissal times for the First Baptist Church of Hamilton Park and the Richardson ISD Math Science Technology magnet school, both located nearby to the east.

- White crosswalk lines parallel to the existing patterned concrete crosswalk across Buckngham Rd at the Central Trail crossing (improvement 2C-SV-CW-27). Add pedestrian warning signs and yield lines and signing. Consider a traffic signal, particularly in conjunction with the future extension of the Central Trail south of Buckingham Rd. A full traffic signal should be considered instead of a RRFB or pedestrian hybrid beacon due to the adjacency to the existing DART railroad crossing gates and potential driver confusion with alternative meanings of flashing red lights.

As discussed in Section 3.1.4, some pedestrians were observed crossing Spring Valley Rd directly below the rail overpass instead of at the adjacent signalized crosswalks 200 feet in either direction. A crosswalk improvement for more direct pedestrian travel along the trail would pose an undue constraint on vehicular signal coordination given the short distance to the signalized crosswalks. The City of Richardson should coordinate with DART to consider adjusting the location of bus stops and installing aesthetic anti-climb median fencing (improvement 2C-SV-GR-25) along the median of Spring Valley Rd in front of the DART station to ensure pedestrians cross at the crosswalks.

Additional details about other improvements recommended in Figure 2C-2, as well as challenges associated with the recommended gaps to remain, are included in the expanded narrative and matrix notes for Spring Valley Station that can be found in Appendix I and Appendix J.

3.3 Half-Mile Area Opinions of Probable Construction Cost

In addition to the Opinions of Probable Construction Cost (OPCC's) developed for the on-site improvements at DART Stations in Section 3.1, OPCC's were developed for nearly 1,100 separate high-priority improvements totalling nearly 58 linear miles in the half-mile areas surrounding each of the 28 DART stations within the study area.

OPCC's were developed in the half-mile areas for each high-priority improvement that was *not* assumed by City staff to be built by others (as part of another project by a developer, the City, TxDOT, etc.) in the near future. Aggregate OPCC's were developed for low- and medium-priority improvements by extrapolating average costs from the high-priority improvements.

Appendix G details the assumptions that were made in order to provide high-quality, yet preliminary OPCC's. Detailed unit price and quantity estimates for the individual high-priority Phase 1 half-mile area improvements are listed in Appendix K which supplement the OPCC's for the proposed DART property improvements in Plano provided in Appendix H. A summary of how overall cost estimates for low- and medium-priority Phase 2 and Phase 3 improvements were derived is also included in Appendix K.

The estimated cost of all projects in Richardson is summarized in Table 2. For convenience, grand total costs are provided in both 2020 dollars and 2025 dollars, assuming for 2025 a 4% annual escalation rate for all three phases. Costs presented in all other figures, tables, and appendices of this report reflect 2020 dollars only.

Table 2: Summary Opinion of Probable Construction Cost for Improvements in Richardson

Station No.	Station Area	DART Station Property	Half-Mile Area				
			High Priority (Phase 1)	Medium Priority (Phase 2)	Low Priority (Phase 3)	*Grand Totals (2020)*	*Grand Totals (2025)*
1C	CityLine Bush	$83,000	$338,650	$1,153,800	$306,900	*$1,882,350*	*$2,290,200*
2A	Galatyn Park	$0	$3,550,700	$532,400	$2,529,500	*$6,612,600*	*$8,045,300*
2B	Arapaho Center	$169,800	$481,600	$513,800	$1,501,100	*$2,666,300*	*$3,244,000*
2C	Spring Valley	$239,900	$225,500	$215,500	$1,265,600	*$1,946,500*	*$2,368,300*
City of Richardson Totals		*$492,700*	*$4,596,450*	*$2,415,500*	*$5,603,100*	*$13,107,750*	*$15,947,800*

As shown in Table 2, the 2020 total estimate for all improvements in Richardson is about $13.1 million. High-priority Phase 1 multi-modal access improvements within the half-mile station areas inside Richardson City limits are estimated to cost about $4.6 million. Of this total, about $493,000 would be the responsibility of DART on its station properties.

Medium- and low- priority costs for Phases 2 and 3 were estimated by developing more generalized unit costs for five types of improvements, based on all high-priority improvements City-wide. Tables 3-6 on pages 29-30 illustrate this procedure.

The first row in each table lists the total linear feet of high-priority sidewalk, sidewalk repair, and Veloweb/shared use path construction City-wide, along with the respective cost totals. It also lists the overall count and cost of crosswalks, classified as simple crosswalks (implemented with signs and markings ony) or other crosswalks (which include beacons, islands, or signals). The bottom two rows of each table show how the same unit rates per linear foot or per each crosswalk were used to extrapolate overall cost estimates for the medium- and low-priority improvements without estimating costs for individual locations in those categories.

For reference, the unit price of 5 ft-wide sidewalk alone was assumed at $35 per linear foot. The all-inclusive price per linear foot of sidewalk improvements (including items such as pedestrian ramps, utility relocation, retaining walls, driveway reconstruction, contingencies, etc.) was calculated for each of the high-priority improvements, ranging between a low of about $44/LF to a high of about $609/LF. Lower unit costs were associated with simple sidewalk improvements without obstacles, while higher unit costs were associated with higher densities of challenging conditions, especially along short segments.

Table 3: Opinion of Probable Construction Cost for CityLine Bush Station Half-Mile Area (Richardson Only/Excludes Plano)

Phase/ Priority	Sidewalks			Sidewalk Repairs			Veloweb/ Shared Use Paths			Simple Crosswalks			Other Crosswalks (with Beacon, Island or Signal)			
	Lin. Ft	Cost	~$/LF	Lin. Ft	Cost	~$/LF	Lin. Ft	Cost	~$/LF	#	Cost	~$/EA	#	Cost	~$/EA	Total Cost
High Priority (All Richardson)	5,175	$ 905,600	$ 175	1,125	$ 89,100	$ 80	120	$ 39,500	$ 330	4	$ 55,100	$ 13,775	10	$ 633,400	$ 63,340	***
Phase 1/ High*	1,080	$ 354,000	-	-	-	-	-	-	-	-	-	-	2	$ 180,500	-	***
Phase 2/ Medium**	2,265	$ 396,400	$ 175	-	-	$ 80	2,295	$ 757,400	$ 330	-	-	$ 13,775	-	-	$ 63,340	$ 1,153,800
Phase 3/ Low**	-	-	$ 175	-	-	$ 80	930	$ 306,900	$ 330	-	-	$ 13,775	-	-	$ 63,340	$ 306,900
	3,345	$ 750,400		-	-		3,225	$ 1,064,300		-	-		2	$ 180,500		***

** High priority cost opinions are based on field visits and bid item breakdowns, but without the benefit of survey, subsurface utility investigation, or other engineering information typically available for semi-final design.*

*** Medium- and low-priority cost opinions are not based on individual improvements, but instead extrapolated from cost/linear foot calculations for high-priority improvements; actual costs may vary significantly, especially for crosswalk improvements.*

**** Costs for All Richardson include costs attributed to DART and others in calculating average costs per unit length or crosswalk, while excluding costs for improvements on the Galatyn Pkwy bridge over U.S. 75, and therefore do not match other totals shown in Table 2.*

Dates listed are dates when field work was conducted at each station property and surrounding 1/2 mile radius.

Station Group Identification

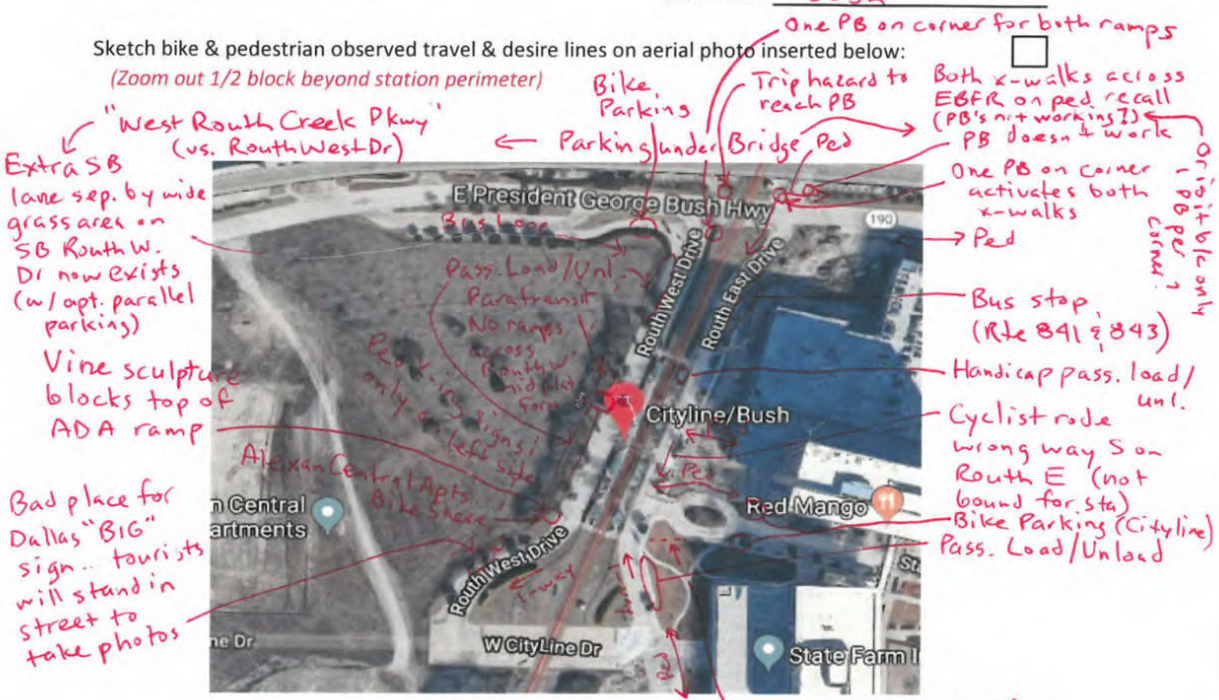
*** Station with high priority improvements for 15% design**

APPENDIX B: Data Collection Maps & Forms

DART Red & Blue Line Last Mile Connections Project
Field Data Checklist - Stations

Date 8/7/18
Station Cityline / Bush
Staff Name Josh

Sketch bike & pedestrian observed travel & desire lines on aerial photo inserted below:
(Zoom out 1/2 block beyond station perimeter)



Are any desire lines missing a marked crossing location on a perimeter street, especially if mid-block? *(If Yes, note on sketch and add line with "New" link ID on Crossings Checklist)* — Y (N)

Note bike parking locations (covered vs. rack vs. bikeshare) No bike parking seen (but dockless bike share yes) — Y N

Do any travel routes differ significantly from linear desire lines? See goat trail notes on larger station map. Incl. parking areas

Note car & bus circulation patterns & conflict points

Bike and ped desire lines continuously lit? (Note where if not). — Y (N)

Trip hazards? Yes, see notes

Landscaping barriers? One, see note (ADA barrier only)

Fences? N

Absent ramps? N, but very few ramps have det. warn. surf.

Bike/Pedestrian sight distance problems? N

Review questions (Post Construction Column) from p. 6-7 of Ped RSA Checklist

Choose:
I = Intersection
M = Mid-Block

For Int. Leg, choose:
N NE
S SE
E NW
W SW
(N/A for mid-block)

Legend:
Complete in office, confirm in field
Confirm in field

* if ADT is not avail.

Condition Options:
Mkg = Markings
Rsg = Roadside signage
RRFB = Rapid Flash Rect. Beacon
InSgn = In-street signs
Cex = Curb extensions
RCwk = Raised crosswalk

Field Data Checklist - Stations

Date 8/16/18
Station Arapaho
Staff Name Josh

Sketch bike & pedestrian observed travel & desire lines on aerial photo inserted below: ☑
(Zoom out 1/2 block beyond station perimeter)

Are any desire lines missing a marked crossing location on a perimeter street, especially if mid-block? *(If Yes, note on sketch and add line with "New" link ID on Crossings Checklist)* (Y) N Woodsill ?

- ☑ Note bike parking locations (covered vs. rack vs. bikeshare)
- Do any travel routes differ significantly from linear desire lines? mostly not exc. crossing Greenville or U.S. 75 — Y ☑ N
- ☑ Note car & bus circulation patterns & conflict points
- Bike and ped desire lines continuously lit? (Note where if not). — Y ☑ N
- Trip hazards? N
- Landscaping barriers? Mostly appropriate
- Fences? Taller to discourage crossing Greenville
- Absent ramps? Only mid-platform, but of little conseq.
- Bike/Pedestrian sight distance problems? (Mirror at bottom of platf. ADA ramp)
- ☐ Review questions (Post Construction Column) from p. 6-7 of Ped RSA Checklist
- ☐ Other Notes:

Spring Valley Station
February, 2018
08/28/18
J.S. & S.S
Spg Valley
Trip Haz. (near Pappadeaux Seafood)
One bad SW segment near Wizards Sports Cafe (low spot where water appears to pond)
* Poor SW, 1 seg., could be combined w/ adj. project
Small SW gap (code red) S of DW between Avis & Lamborghini
2 trip haz.
Driveways
Multiple trip hazards
Ped signs face traffic on right hand side only
X-walk hidden behind horiz. curve (Limited Sight Distance/30 mph sign here)
Median impedes xings
Single house (320 Huffines has SW)
Curb ramps missing (brand new alley)
Stop
Central Trail (Add links)
Sara's Market & Bakery
Food bank market
Dumpster blocks SW
Add SW links
Large tree 3' EW from b/c to roots
Trip Haz. & Drainage Problem
Goal trail connects to alley
SW here (small gap adj. to sta.) Provide ramp or short SW segment
3.5' EW catering trucks backed over SW
DART Parking
Maple
5' EW (ret. wall)

DART Red & Blue Line Last Mile Connections Project
Field Data Checklist - Sidewalk Gaps

Date 08/28/18
Station Spg. Valley
Staff Name L.L. & H.B.
Location Burlington Rd. between Railway Track & bridge (SS)

Instructions : When coding/confirming sidewalk condition of "Nonexistant" on sidewalk checklist, review the following and make notes here and/or on the sidewalk checklist.

What challenges are there to the feasibility/practicability of sidewalk?
Circle items below and add notes/sketches as applicable.

Utility poles? No
Underground utilities? Maybe
Trees? Yes
Slopes? No
Other structures? No
Rail crossings? No
Business parking/access management issues? No
Insufficient bridge width? No
Take photos and notes to document. ✓

Other Notes:

APPENDIX C: Crosswalk Improvement Evaluation Details

At existing or proposed crosswalks without existing stop sign or signal control, potential improvements were evaluated based on guidance in the Federal Highway Administration's (FHWA) recent publication, "Guide for Improving Pedestrian Safety at Uncontrolled Crossing Locations", dated July 2018. Table 1 of this publication, reproduced herein also as Table C1, includes enhanced guidance on countermeasures that can or should be considered for uncontrolled crosswalks with various combinations of vehicular speed, traffic flow, and number of lanes to be crossed. This appendix describes how the consultant team used Table C1 to produce consistent recommendations for crosswalk improvements, as well as how roadway speed and daily traffic volume data required as inputs to the process were estimated where otherwise unavailable.

In the reproduction of Table 1, red boxes have been added to highlight an example crosswalk to illustrate how the table was used for each evaluation. In the example, four-lane undivided roadways with average annual daily traffic (AADT) over 15,000 vehicles/day and speeds greater than 40 miles per hour have up to six potential countermeasures recommended for possible consideration, as indicated by the six one-digit numbers in the lower right cell of the table. The strongest recommendations are indicated by white numbers in solid black circles. The number "1" inside an outlined circle denotes that marked and signed crosswalks should always occur in conjunction with other listed countermeasures. Numbers without circles around them indicate other improvements which may optionally be considered.

In the example, the number "1" in the lower right cell of the table indicates that high visibility crosswalk markings, parking restrictions on the crosswalk approach, adequate lighting levels, and crossing warning signs should all be employed to create a high visibility crosswalk wherever significant pedestrians demand exists or may be anticipated. But the outlined circle around the number "1" in the table indicates that implementation of these countermeasures alone is insufficent due to the high traffic volumes, high speeds, and large number of lanes to be crossed. One or more of the other options should always therefore be implemented.

The other options to be given strong consideration (based on the white number in the dark circle legend) include "Advance Yield Here for Pedestrian" signs (#3), a median pedestrian refuge island (#6), or a pedestrian hybrid beacon (#9). Other candidate countermeasures that may also be considered include curb extensions (#5) and a road diet (#8).

Note that the unavailable options for these circumstances include a raised crosswalk (#2), in-street pedestrian crossing signs (#4), and rectangular rapid-flashing beacons (RRFB's/#7). Where options such as the RRFB are listed as incompatible with context, research had demonstrated that the combination of speed, volume, or crossing distance would render the treatments less than acceptably effective. The footnotes indicate that some options are mutually exclusive of others.

A Microsoft Excel spreadsheet was created to automate Table 1 as a lookup table and quickly produce the list potentially recommended improvements given the inputs entered for each candidate crosswalk improvement location to be considered for the project. The analyst in each case still used engineering judgment to select which countermeasure options would ultimately be recommended, as indicated by the red boxes around items #1, #3 and #9 (but not #6) in the bottom right corner of the table. Notes as to the rationale for each improvement were made. The inputs, options, recommendations, and notes are tabulated in tables found in Appendix D.

The inputs to the spreadsheet analysis of crosswalk improvements were straightforward for the number of lanes in each case. Posted speed limit was also generally straightforward, though in a few cases with low posted speed limits and high number of lanes (for example, six-lane divided

Table C1: Application of Pedestrian Crash Countermeasures by Roadway Feature

Given the set of conditions in a cell,

- # Signifies that the countermeasure is a candidate treatment at a marked uncontrolled crossing location.
- ● Signifies that the countermeasure should always be considered, but not mandated or required, based upon engineering judgment at a marked uncontrolled crossing location.
- ○ Signifies that crosswalk visibility enhancements should always occur in conjunction with other identified countermeasures.*

The absence of a number signifies that the countermeasure is generally not an appropriate treatment, but exceptions may be considered following engineering judgment.

1 High-visibility crosswalk markings, parking restrictions on crosswalk approach, adequate nighttime lighting levels, and crossing warning signs
2 Raised crosswalk
3 Advance Yield Here To (Stop Here For) Pedestrians sign and yield (stop) line
4 In-Street Pedestrian Crossing sign
5 Curb extension
6 Pedestrian refuge island
7 Rectangular Rapid-Flashing Beacon (RRFB)**
8 Road Diet
9 Pedestrian Hybrid Beacon (PHB)**

*Refer to Chapter 4, 'Using Table 1 and Table 2 to Select Countermeasures,' for more information about using multiple countermeasures.

**It should be noted that the PHB and RRFB are not both installed at the same crossing location.

This table was developed using information from: Zegeer, C.V., J.R. Stewart, H.H. Huang, P.A. Lagerwey, J. Feaganes, and B.J. Campbell. (2005). Safety effects of marked versus unmarked crosswalks at uncontrolled locations: Final report and recommended guidelines. FHWA, No. FHWA-HRT-04-100, Washington, D.C.; FHWA. Manual on Uniform Traffic Control Devices, 2009 Edition, (revised 2012). Chapter 4F, Pedestrian Hybrid Beacons. FHWA, Washington, D.C.; FHWA. Crash Modification Factors (CMF) Clearinghouse. http://www.cmfclearinghouse.org/; FHWA. Pedestrian Safety Guide and Countermeasure Selection System (PEDSAFE). http://www.pedbikesafe.org/PEDSAFE/; Zegeer, C., R. Srinivasan, B. Lan, D. Carter, S. Smith, C. Sundstrom, N.J. Thirsk, J. Zegeer, C. Lyon, E. Ferguson, and R. Van Houten. (2017). NCHRP Report 841: Development of Crash Modification Factors for Uncontrolled Pedestrian Crossing Treatments. Transportation Research Board, Washington, D.C.; Thomas, Thirsk, and Zegeer. (2016). NCHRP Synthesis 498: Application of Pedestrian Crossing Treatments for Streets and Highways. Transportation Research Board, Washington, D.C.; and personal interviews with selected pedestrian safety practitioners.

roadways with posted speed limits of 35 mph) a higher prevailing speed was assumed based on engineering judgment and substituted for the posted speed limit.

In many cases, recent AADT volumes for the subject roadways for the crosswalks being evaluated were available from City or TxDOT data. Historic AADT volumes were grown at 2% annually to 2019 and used directly as inputs for the crosswalk countermeasure selection analysis.

In other cases where AADT data was not already available, particularly on collector streets, a "short-cut" method for estimating AADT without collecting new 24-hour traffic counts was developed to balance accuracy with the large amount of data to be collected and the lack of precision necessary to select the appropriate sets of columns in Table C1.

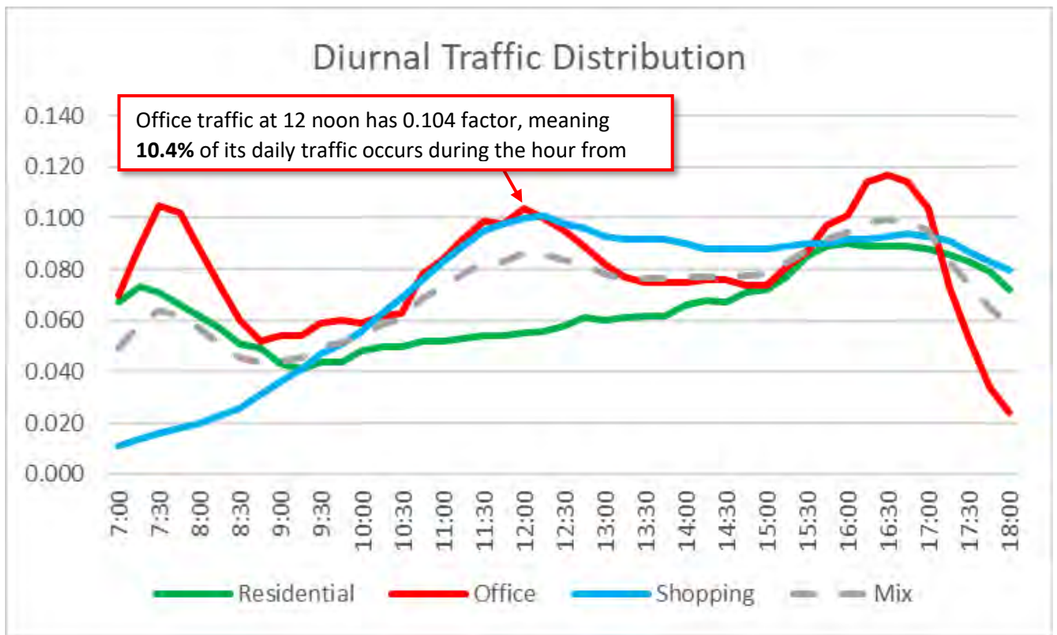
Short two-minute traffic counts were collected by consultant staff in the field at crosswalks that had been pre-selected as candidates for improvements. A two-minute time period was selected to account for the cycle length of most signalized intersections that might be nearby and therefore affect the distribution of traffic volumes. The count could be taken anytime during daylight hours to maximize field work efficiency for multiple locations.

These two-minute volumes were factored by the Excel spreadsheet program to represent approximate AADTs. The two-minute volumes are expanded to hourly volumes by multiplying by 30. The hourly volumes are then expanded to daily volumes using a lookup table based on the 15-minute period during the day that the two-minute count was taken, the adjacent land use category noted by data collection staff, and factors that were derived from data in the Institute of Transportation Engineers' (ITE) *Trip Generation Manual*, 10th Edition for the percentage of traffic generated by different land uses at different times of day.

For each crosswalk, the analysis characterized the land use contributing to traffic at a particular crosswalk as residential, office, shopping center, or a mix of the three. Figure C1 identifies the hourly-to-daily converstion factors derived for each land use by time of day. The "mix" category was computed by averaging the values from the other three land uses.

Note that office traffic has the most distinct "peaks" with the largest percentage of its traffic occuring near morning arrival, lunch hour, and afternoon departure times. Residential traffic peaks in the morning and afternoon without the distinct lunch peak, while generally increasing in the afternoon. Shopping center traffic is very low in the morning, with higher levels in the afternoon and evening.

Figure C1: Hourly to Daily Traffic Conversion Factors, by Land Use & Time of Day



To convert from hourly to daily traffic, the hourly total was divided by the selected conversion factor to get a daily traffic estimate. For example, a two-minute count of 40 vehicles taken at noon across an uncontrolled crosswalk near a large office building would first be converted to an hourly volumes of 1,200 vehicles/hour (=40 x 30). Then, the hourly volume would be converted to a daily volume by dividing 1,200 vehicles/hour by the 0.104 factor selected from Figure 7 to yield ~11,540 vehicles/day.

Note that daily traffic volume estimates derived in this way are not assumed to be accurate enough for most traffic analysis purposes, but were assumed to be valid for planning-level purposes such as selection of the appropriate columns in Table C1.

In cases where road diets were recommended, the consultant team compared the City/TxDOT AADT or estimated daily volume and the proposed number of lanes for the roadway with the maximum service volumes assumed per lane in NCTCOG's Dallas-Fort Worth Regional Travel Model, shown in Table C2. Road diets were only recommended if roadways would likely still have excess capacity after the lane reductions.

Table C2: NCTCOG Roadway Capacity for Divided or One-way Roads

Area Type	Functional Class						
	Freeway	Principal Arterial	Minor Arterial	Collector	Ramp	Frontage Road	HOV
	Hourly Service Volume Per Lane

APPENDIX E: Half-Mile Area Improvement Prioritization – Initial Trial Methodology Details

To provide opportunities for the greatest number of additional people to walk or bike to DART stations by building sidewalk, shared use path, and crosswalk connections, the prioritization of identified improvements was structured to provide balance between estimating this objective accurately and applying the methodology to a large study area.

Initially, a prioritization scheme that attempted to track as closely as possible to potential ridership increases was tested for the Parker Road Station in Plano, with adjustments for safety, key destination access, and equity. Though some of the elements of this initial prioritization methodology were ultimately discarded for this study, they are documented here as being potentially useful for later studies on a smaller scale. Also, many of the assumptions and methodologies explained below were retained in the ultimate methodology.

For the ridership component of the initial methodology, the likelihood of land parcels around each station to contribute potential transit customers walking or biking to the station was assumed to be related to three primary factors:

1. The distance of the parcel from the station,
2. The number of people living or employed at the parcel, and
3. People's tolerance for different levels of stress experienced along the route between the parcel and the station.

For the first input to ridership, distance, NCTCOG had previously collected appraisal district parcel data from Collin and Dallas Counties and provided a GIS shapefile containing the data. Consultants used ArcGIS Network Analyst tools to calculate the distance of each parcel to the station along the nearest available walking route, which was created by editing sidewalk shapefiles provided by NCTCOG to ensure end-to-end connectivity. The NCTCOG sidewalk files were found to require significant numbers of edits in this regard.

For the second component of ridership, population density, NCTCOG had included in the parcel-level data assumed population and employment values for individual parcels in the study area that had been calculated as part of a previous project. These values had been calculated by land use based on building square footage and assumed densities (for example 300 square feet/person for office land use).

Consultants used GIS tools to tabulate the total number of people who might use each sidewalk and crosswalk segment for first and last mile trips based on the parcel population totals and the shortest distance routes along available sidewalks and crosswalks between each parcel and the station. This collection of routes was designated as the "pedestrian tree" for the station. Figure E1 shows an example pedestrian tree for Parker Road Station, with one "branch" of the tree to a 662-resident apartment complex highlighted in purple that could be shortened by constructing new sidewalk along a path worn in the grass by pedestrians who already take the shortcut.

This technique allowed modeling of how individual travelers would collectively contribute greater ridership increases along pedestrian routes with the highest density of population and employment.

Figure E1: Concept of Pedestrian Trees Illustrated

For the third assumed input to ridership, pedestrian stress could be due to uncomfortable circumstances such as high traffic speeds along the route, narrow sidewalks in close proximity to traffic, or multi-lane crossings of busy streets. This concept of "Pedestrian Level of Traffic Stress" (PLTS), was adapted for pedestrians by the Oregon Department of Transportation[1] from a similar method developed for bicyclists in 2012 by researchers from San Jose State University and the Northeastern University College of Engineering[2].

The PLTS method assigns scores to sidewalk and crosswalk segments for their levels of pedestrian stress, with scores ranging from 1 for low stress to 4 for high stress conditions. Details on the PLTS model methodology are available at the sources indicated in the footnotes.

Consultants used inputs from the field data collection in the half-mile area around Parker Road Station to create a spreadsheet program for calculating PLTS scores based on a series of look-up tables defined in ODOT's methodology, with some adaptations for local Dallas-area conditions. They then joined these scores to sidewalk shapefiles in an ArcGIS model. An example map produced from this model is shown in Figure E2, highlighting in red the higher stress PLTS 4 conditions present along higher speed arterials near Parker Road Station. Potential riders unwilling to walk along higher stress PLTS 3 or PLTS 4 sidewalks in orange and red would only have access between the Parker Road Station, its adjacent parking lots, and some commercial properties to the west, but not to any residential areas in the vicinity.

The PLTS results were then used to refine the earlier estimates of how many residents and employees might use each sidewalk and crosswalk segment for their first and last mile trips. Generalized assumptions were developed for the percentage of transit riders with trip ends within a half-mile of

Figure E2: Existing PLTS Ratings for Portion of Parker Rd Station Area

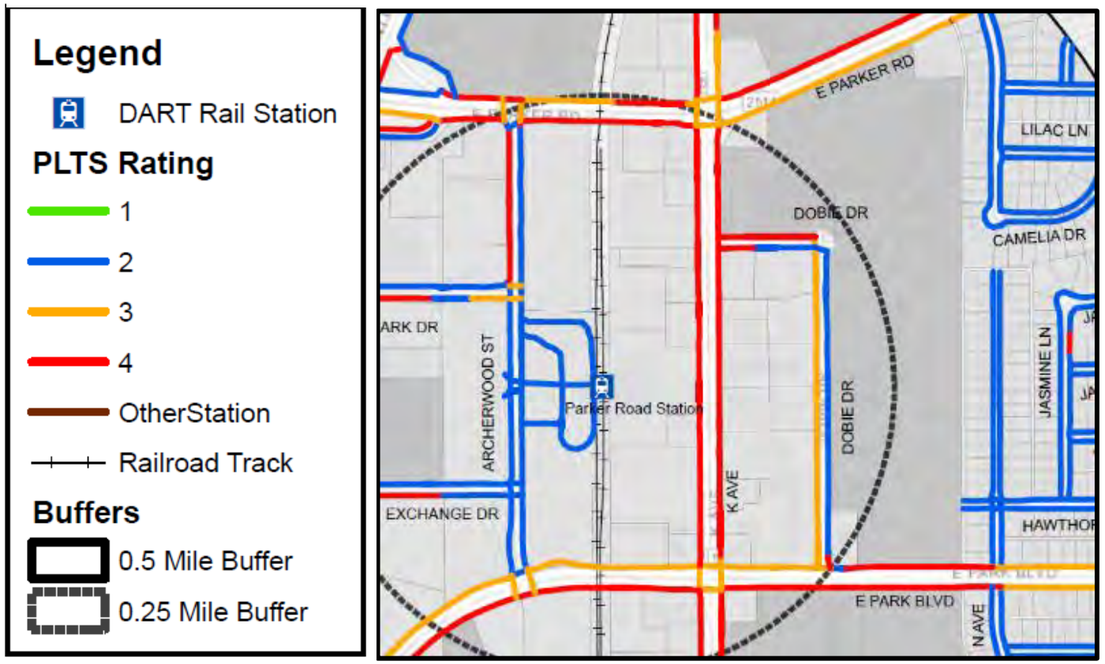

Figure E3: Data for Four Types of Cyclists Assumed Speculatively as Similar for Pedestrians

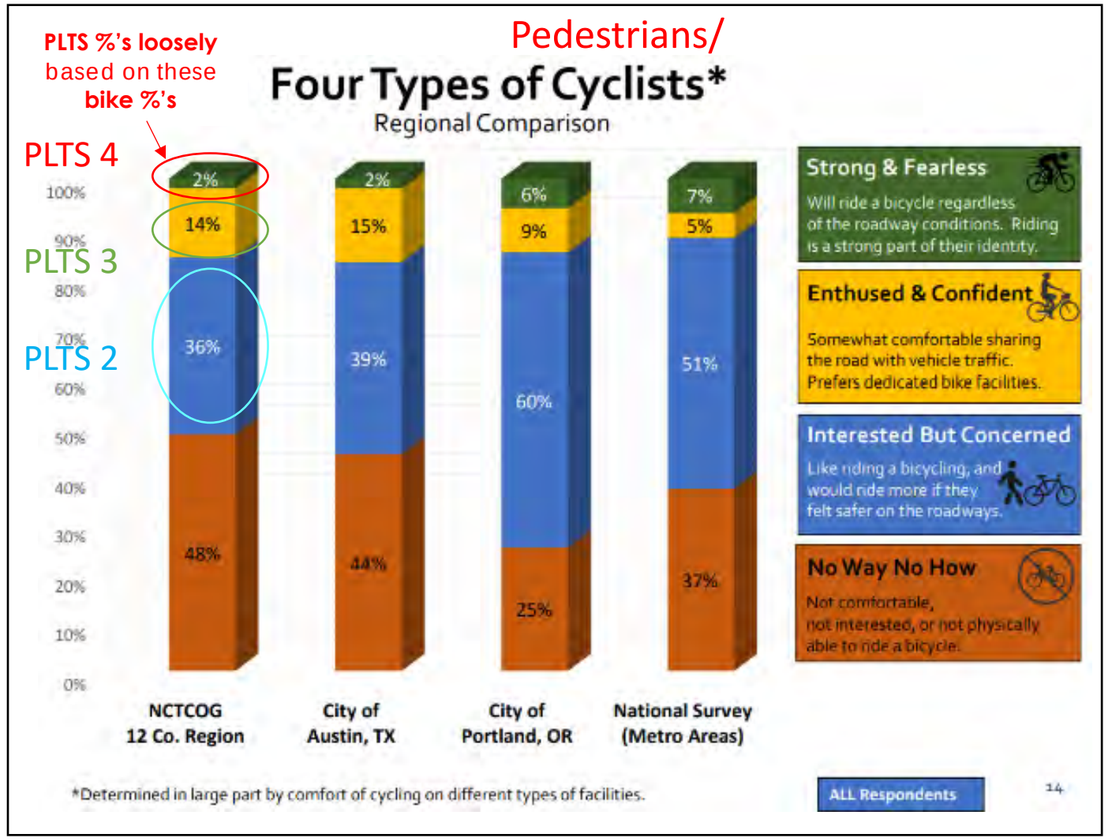


the station who would be willing or able to travel via sidewalks and crosswalks of varying PLTS stress levels. Absent more specific data, these percentages were aligned loosely (and admittedly speculatively) with survey data about the four types of cyclists as found in a recent NCTCOG survey illustrated in Figure E3. The assumed split for different groups of transit riders follows:

- 45% of transit riders were assumed to not walk or bike to transit regardless of the stress level, either based on ability or preference for car travel (similar to 48% No Way No How for bikes).
- Up to 35% of transit riders were assumed to walk or bike to transit if they could travel exclusively on PLTS 1 or PLTS 2 sidewalk and crosswalk facilities (similar to 36% Interested But Concerned for bikes).
- Up to 15% of transit riders were assumed willing to travel on PLTS 3 facilities (similar to 14% Enthused & Confident for bikes).
- Up to 5% of transit riders were assumed willing to travel on PLTS 4 facilities (similar to 2% Stong & Fearless for bikes).

More research would be ideal to investigate actual values for these assumptions.

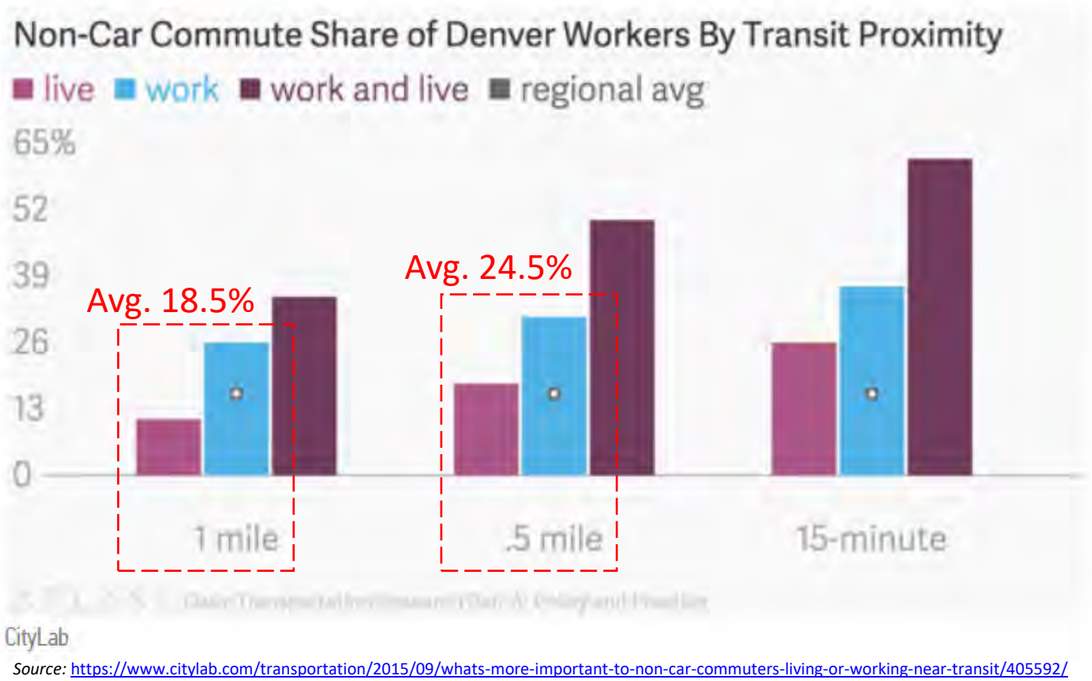
Note that some of the in the PLTS 3 or 4 categories might be termed transit-dependent riders who don't have access to a car and for whom bus transfers to the station are not sufficiently convenient.

Each of the above assumed percentages was reduced based on a sliding scale for the distance of the parcel in question from the station. The sliding scale was based on data from a 2015 University of Denver study illustrated in Figure E4 that explored the proximity relationship of the non-car commute share of Denver workers based on transit proximity. The study found that the average percentage of people living or working within 1 mile of the station who used a non-car commute mode was about 18.5%. Within a half-mile of the station, the percentage increased to about 24.5%.

As shown in Figure E5, plotting these two points from Figure E4 in a linear relationship allows for an extrapolated assumption that no more than 30% of people living or working immediately adjacent to a transit station (at a theoretical 0 mile walking distance) would use a non-car commute mode.

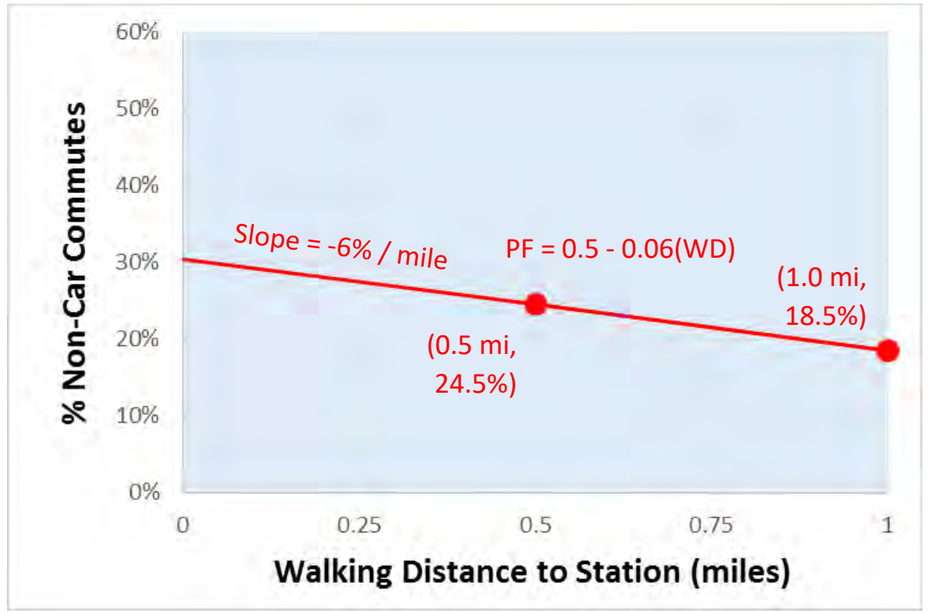
It was surmised that the Denver data (as with all real-world cases) would represent non-ideal conditions constrained by imperfect sidewalks and pedestrian stress levels similar to those present in the Dallas metroplex and other cities. Therefore, since the object of the above-described analysis was to account for pedestrian stress more directly, it was surmised that a nominal value of 20% be added to the equation shown in Figure E5 to normalize the relationship for ideal conditions and adjustment using the PLTS methods instead. This adjusted relationship for a proximity factor to

Figure E4: Findings of 2015 University of Denver Study



Source: https://www.citylab.com/transportation/2015/09/whats-more-important-to-non-car-commuters-living-or-working-near-transit/405592/

Figure E5: Extrapolated Relationship from 2015 University of Denver Study



provide the percentage of transit riders using non-car modes to reach the station under ideal sidewalk and crosswalk conditions based on distance from the station is shown in Figure E6.

Separate ArcGIS models were created around the Parker Road Station for two different partial pedestrian networks in addition to the full existing pedestrian network described earlier. These represented pedestrian networks that would be accepted by the segments of the transit riding population "Interested but Concerned" and "Enthused and Confident" about walking or riding to the station.

One network included only PLTS 1 and PLTS 2 links as route options (the blue lines in Figure 9) and therefore served the most limited number of parcels. Another network allowed for travel on PLTS 3 segments (the orange lines in Figure 9) in addition to PLTS 1 and PLTS 2. This network would serve a larger number of parcels. An overall estimate of existing ridership for Parker Road Station was calculated using the above-described inputs. For each parcel, a separate calculation for each PLTS group of transit riders was made as follows:

PLTS 1+2: Parcel population x Proximity Factor x 35% of transit riders in PLTS Group

PLTS 3: Parcel population x Proximity Factor x 15% of transit riders in PLTS Group

PLTS 4: Parcel population x Proximity Factor x 5% of transit riders in PLTS Group

Figure E6: Adjusted Relationship Assumed for Proximity Factor

Criteria	Weight
Employment and Population Density (Number of potential riders connected by the improvement's catchment area)	50
Distance / Proximity of Improvements to the Station	25
Walkshed Trip Length Reduction (Catchment area benefitting from a reduced walk distance to the station)	5
Land Use Types and Key Destinations (e.g. schools, government buildings, social services, hospitals, large shopping centers, parks)	5
Crash History (Number of crashes in the general area of the project improvement)	5
Safety Benefit (Speed limit as a surrogate for systemic safety of the project improvement)	5
Equity / Transit Dependent Populations (Minority households, % below poverty line)	5

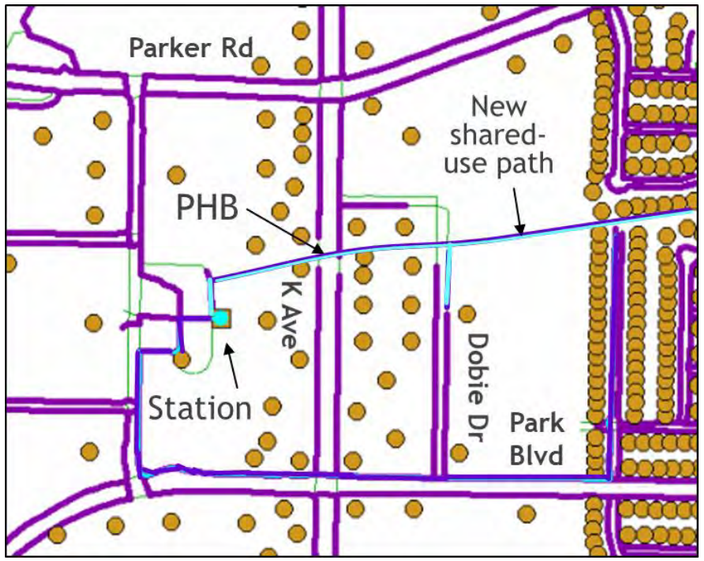
Note that the proximity factor was potentially different for each PLTS group, indicating that more selective travelers could only reach the station by following a longer path consistent with their intolerance for more stressful conditions. For parcels not connected to the station at all at a given PLTS (including PLTS 4) no ridership was assumed for that parcel as a simplifying assumption (despite the fact that many travelers, including those dependent on transit, can and do walk to the station without the benefit of sidewalk or crosswalk facilities).

The resulting estimate of existing non-car commuting trips to and from Parker Road Station was 631 people for existing conditions. This compared very favorably with 2015 survey data that had been provided by DART, indicating that 619 of the daily average riders either walked or biked to Parker Road Station.

Proposed sidewalk and crosswalk improvements were then added to the ArcGIS models for Parker Road Station so that an increase in ridership could be forecast. These are illustrated in Figure E7, which is an annotated screen capture from the GIS model where sidewalks and crosswalks are shown in purple or blue and parcel centroids are shown as brown circles.

With the originally proposed improvements, including a shared use path and pedestrian hybrid beacon (PHB) extending east of the station across K Ave, forecast ridership by non-car commute to the station was forecast to increase from 631 people to 1,018 people, a 61% increase.

Figure E7: Excerpt of Sidewalk Network, Including Originally Proposed Improvements near Parker Road Station

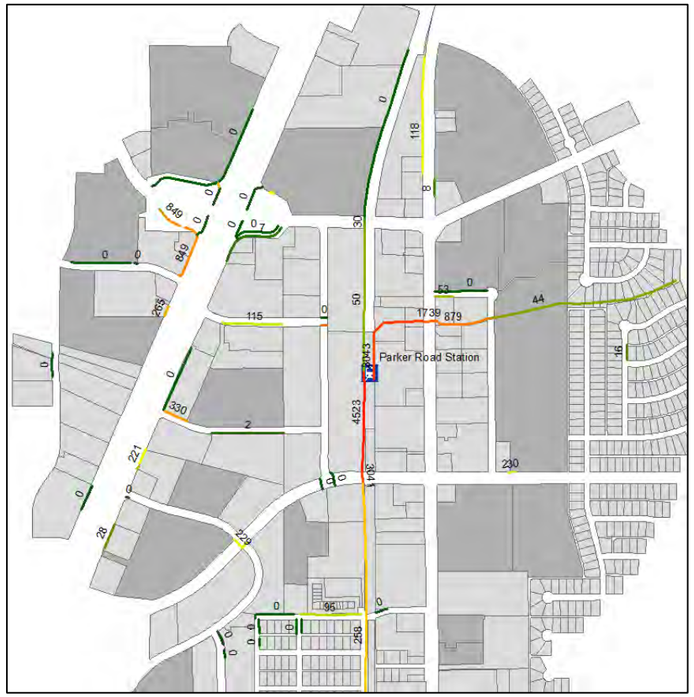


APPENDIX F: Half-Mile Area Improvement Prioritization – Final Methodology Details

After review of the process described in Appendix E, NCTCOG and the consultant team determined that the extensive editing required to the GIS shapefiles for existing sidewalks would not allow for the same level of effort at each of the 27 additional stations without compromising in other areas of the analysis. Data entry from field work could be reduced by bypassing the PLTS calculations. Finally, it was felt that some of the inputs were too speculative, despite the reasonable agreement between the existing condition model forecast and the recent DART ridership surveys.

Consequently, the prioritization process was simplified by providing separate scores for employment and population density without attempting to correlate these to ridership levels. The methods described previously were used to identify the parcel employment and population tributary to each sidewalk and crosswalk segment, without using a proximity factor or PLTS scores. Distance of each improvement from the station (measured linearly in a straight line for greater simplicity) was separated into a distinct scoring criterion, along with other scoring criteria for walkshed trip length reduction, land use types, key destinations, crash history, safety benefits, and equity. The weighting given to each criterion is shown in Table 1, in Section 2.9 of the report.

Figure F1: **Employment and Population "Tributary" to** Sidewalk & Crosswalk Improvements



Employment & Population Density

Figure F1 illustrates the process used to score improvements on the first criterion in Table 1, employment and population density. It shows the parcels in the Parker Road Station area, with darker shades of gray representing higher population/ employment totals. Note that, while some of the improvements shown in Figure F1 and other figures that follow, such as the sidewalk, pedestrian hybrid beacon, and shared use path to the east of the station, were later revised based on input from the City of Plano, the principles illustrated still apply.

In the figure, each sidewalk and crosswalk improvement link is shown in red, orange, yellow, or green colors depending on the total employment plus population that would be "tributary" to the station via the improvement once all proposed improvements are constructed. The tributary employment plus population values are shown next to each link, with the red links closest to the station having the highest values.

As a simplifying assumption, parcels straddling the half-mile boundary from the station were included in their entirety without any reductions, but parcels beyond the half-mile boundary were not considered to contribute to the analysis even though some travelers (particularly bicyclists) may be willing to travel without a car for longer distances.

Note that some improvements would have zero expected employment and population because the links connect to parcels that are currently vacant or to parcels that were assumed to have redundant, shorter routes to the station via another street or via the opposite side of the same street.

Figure F2: Proximity of Improvements to Station

Each improvement was assigned a score of 0-50 points, interpolated linearly based on the relative level of employment and population for the improvement, ranging from 0 to the maximum project-wide estimated value of 11,787.

Distance

Figure F2 illustrates the process used to score improvements on the second criterion in Table 1, distance to the station. Each improvement is shown color-coded based on the distance of its midpoint to the station, measured linearly "as the crow flies" for simplicity. Improvements that connect directly to the station have a distance of 0.0 miles. The figure shows the closer improvements shown in green and the most distant improvements in red. Points were assigned to each improvement on a linear scale ranging from 25 points for 0 miles from the station to 0 points at 0.5 mile from the station.

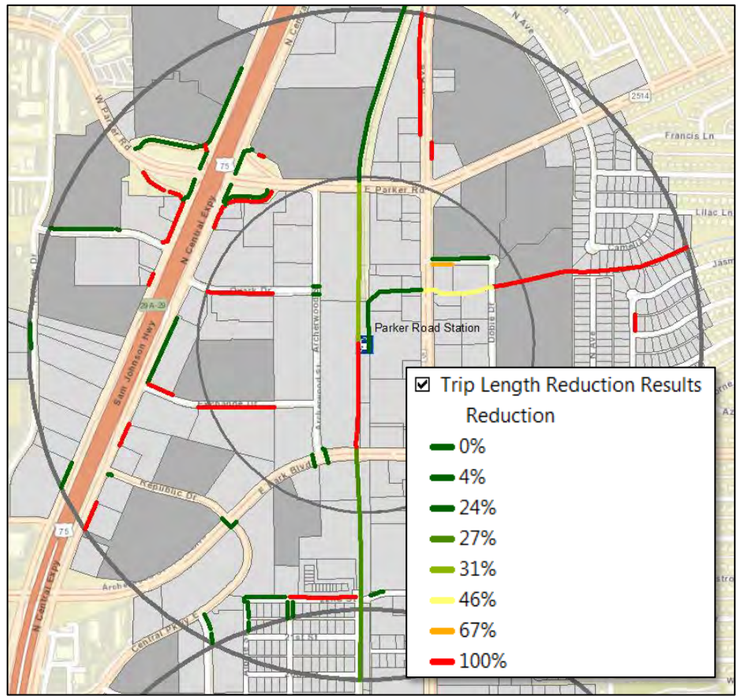
Walkshed Trip Length Reduction

Figure F3 illustrates the process used to score improvements on the third criterion in Table 1, walkshed trip length reduction. Each improvement is shown color-coded based on the percentage reduction in walking distance to the station that would occur for the population of a reference parcel selected as representative of most parcels tributary to the improvement in question. In general, the highest population parcel was chosen. When most parcels were of similar population, such as in single-family home neighborhoods, the farthest parcel was usually selected.

For each improvement, the walking distances from the reference parcel to the station along the existing and proposed pedestrian networks were measured using Network Analyst in ArcGIS. The difference between the two values was calculated as the walkshed trip length reduction.

Consideration had been given to creating a weighted average trip length reduction for all parcels, but this would have required tedious measurements and/or custom macros in ArcGIS. Therefore, this idea was abandoned for the final analysis.

Figure F3: Walkshed Trip Length Reduction



In Figure F3, improvements that would reduce trip length by a high percentage are shown in red or orange. These include improvements that would connect parcels with no existing sidewalk access to the station, which was considered for scoring purposes a 100% reduction (to avoid divide by zero errors). Lower percentages of trip length reduction are shown in yellow and shades of green. Scores for this category were assigned ranging from 0 points for no reduction in walking distance to 5 points for either a newly connected reference parcel or a reduction in walking distance greater than 40%.

Access to Land Use Types & Key Destinations

The fourth criterion for scoring improvements was access to other land use types and key destinations. Proximity to residential and employment uses had already been accounted for in the first criterion. However, other land uses with a high number of visitors also needed to be accounted for. Land uses and destinations deserving of special access consideration were as follows:

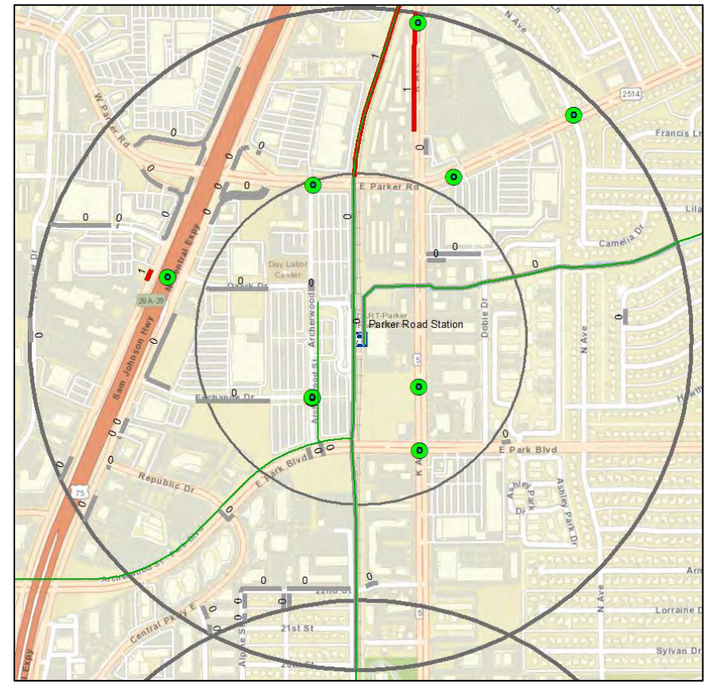
- Hospitals, clinics, urgent care
- Places of worship
- Schools
- Government buildings[3]
- Libraries, museums
- Grocery stores, malls, supercenters, hotels, motels
- Entertainment, fine arts, parks, landmarks, athletic facilities
- Senior living, community centers, gardens
- Bus stops with >25 daily boardings

A shapefile was created for locations in the above categories. Bus stop boarding information in GIS format was obtained from DART for analysis. Bus stops immediately adjacent to the DART rail stations were excluded as being redundant to the distance prioritization criteria, which already prioritizes proximity of the improvement to the station.

For each improvement, the number of key destinations within 250 feet were tabulated. Also tabulated for improvements greater than ¼ mile from the station were the number of bus *routes* within 50 feet of the improvement. The intent of this last criterion was to add emphasis on routes that would more often save time for those walking or biking to the station. Routes closer than ¼ mile were generally considered less useful for this purpose, since a walk to the station would more frequently take less time than waiting for the next bus.

For the access criterion, points were assigned ranging from 0 points for no nearby destinations or qualifying bus routes to 5 points for 5 or more nearby destinations or bus routes. Since some arterial streets may have several bus routes without necessarily having many stops or destinations nearby, the number of points contributed by bus routes was limited to no more than 3 points.

Figure F4: Relative Scarcity of Bicycle & Pedestrian Crashes



Crash History

The fifth criterion for scoring improvements in Table 1 is crash history. A GIS shapefile was used containing the point location of all reported bicycle and pedestrian crash locations for the study area from 2013 to 2017.

Figure F4 shows that in many places, such as the Parker Road Station half-mile area, bicycle and pedestrian crashes shown by green circles are relatively rare and random occurrences. In areas of lower density development and pedestrian activity, the crashes tend to be scattered throughout the study area, mostly along major arterials. Other station areas with higher density development and greater multi-modal activity experienced higher numbers of pedestrian and bicycle crashes. Since it was not possible within the scope of this project to collect pedestrian volume data, the crash data was observed to serve as somewhat of a surrogate for pedestrian demand. Therefore, a cluster of crashes may be more indicative of a place where many people walk than of a place that's more dangerous to walk in terms of the risk to individual pedestrians.

[3] in categories with an assumed high number of visitors, such as courthouses

Unfortunately, the available crash database had little detail on the nature of the crashes. For the crash shown along U.S. 75 in Figure F4, for example, the database indicated it involved a pedestrian with an incapacitating injury. However, the database did not detail what either the pedestrian or the driver involved were doing prior to the crash.

There is a sidewalk gap at this location, so perhaps the pedestrian was walking in the travel lanes of the southbound frontage road to avoid the gap. But the pedestrian could also just as well have been changing a flat tire or jaywalking across the freeway mainlanes. So, the crash data may offer some insights, but is still limited in its value for assigning relative benefits to different improvements.

The project team considered requesting police crash reports for the individual crashes and classifying them using the Federal Highway Administration's Pedestrian and Bicycle Crash Analysis Tool (PBCAT). This tool would allow for more significant insights to be drawn from a greater wealth of crash data, leading to better screening of which crash locations might be more or less susceptible to correction by certain countermeasures versus others. However, the extra effort required to code crashes was outside the scope of the project.

For the crash history criterion, improvements were scored from 0 to 5 points based on the number of bicyle- and pedestrian-related crashes within 250 feet of the improvement during the 5-year period analyzed. Figure F4 shows that only two improvements scored points near Parker Road Station. The two links in red each received 1 point for being near a single crash.

No differentiation was made in the scoring for bicycle versus pedestrian crashes or between crashes of different severity. While this data was available in the database, most bicycle and pedestrian crashes have a high potential for being serious or fatal, so it was determined any differentiation in the sparse data could be the result of statistical noise and was therefore less significant in differentiating which improvements would be of greatest benefit for positive safety outcomes.

Safety Benefit

A more recent development in transportation safety research that is designed to combat the drawbacks of traditional crash analysis mentioned in the previous section is the concept of "systemic safety." Systemic safety is a term that refers to safety approaches that are data driven, network-wide, and which consider improvements at locations with similar characteristics to high crash locations, even if the locations where improvements are to be considered or proposed don't themselves have significant crash history. The process is somewhat akin to extrapolating where it is believed crashes are more likely to occur over a longer period of perhaps 20 or 30 years, based on risk factors identified at the locations of recent crashes.

The scope for this project is in itself somewhat systemic in that areas within a half mile of light rail stations were generally observed to show higher bicycle- and pedestrian-related crash frequency than were other areas of the Dallas-Fort Worth region in general. Again, this result is not surprising due to the expected higher prevalence of multi-modal travel demand near transit stations.

As a second measure of systemic safety, the project team opted to use the posted speed limit of the roadway adjacent to sidewalk improvements or crossed by crosswalk improvements. Vehicular speed is widely regarded as having a high correlation to safety outcomes in bicycle and pedestrian crashes, as illustrated by a popular graphic in Figure F5 from the Seattle Department of Transportation.

Figure F5: Generalized Relationships between Impact Speed & Pedestrian Survival Rates

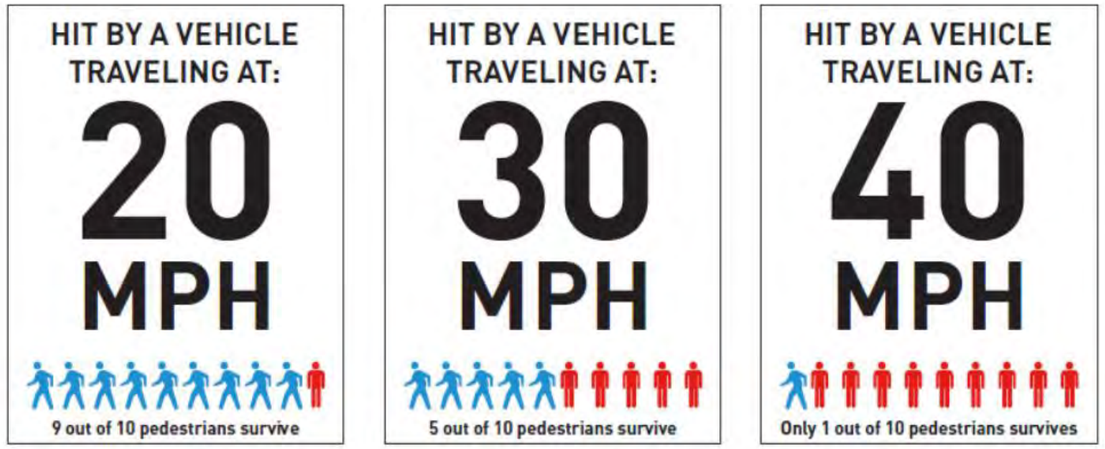


Image: Seattle Department of Transportation

The project team felt that posted speed limit was the single most important safety variable that could be easily measured and isolated, since data on posted speed was readily available in a GIS shapefile. While other variables such as 85th percentile speed and traffic volumes may be important to consider in a more detailed systemic safety study, they were determined to be outside the data collection scope of this project.

The associated scores for the safety benefit criterion ranged from 0 points at or below 20 mph to 5 points at or above 45 mph.

Shared use paths or sidewalks not adjacent to roadway alignments received 0 points for this category. Some consideration was given to assigning points for these types of off-street facilities or sidewalks along low-speed streets to prioritize safer alternatives to walking along high-speed roads. However, ultiimately it was decided that inverting the scoring system in this way would de-prioritize existing gaps along higher speed streets, which are typically the "weakest links" in the multi-modal network that lead to the greatest number of decisions to avoid pedestrian and bicycle trips.

Figure F6 shows the Parker Road Station area with the speed limit of the adjacent or crossed street identified next to each improvement, which is color-coded based on the speed limit. Red and orange improvements are near roadways with speed limits of 45 mph or greater, yellow improvements are along or crossing 40 mph roadways, and improvements are shown in green for 30 mph streets.

Equity

The final criterion for prioritizing projects was equity, which seeks to emphasize improving communities with populations that have not historically received equal access to resources. The consultants were provided spatial data covering the project area for an equity metric, the Environmental Justice Index. This index is compiled by NCTCOG to comply with federal rules for identifying Environmental Justice populations. It is based on data from the 2013-2017 American

Community Survey, aggregated at the census block level. Each census block is categorized if the percentage of its residents is higher than the regional average for minority population, low income, or both. Figure F7 shows a map of Environmental Justice Index areas for the areas including the 28 half-mile station areas for the Red & Blue Lines Last Mile Connections project.

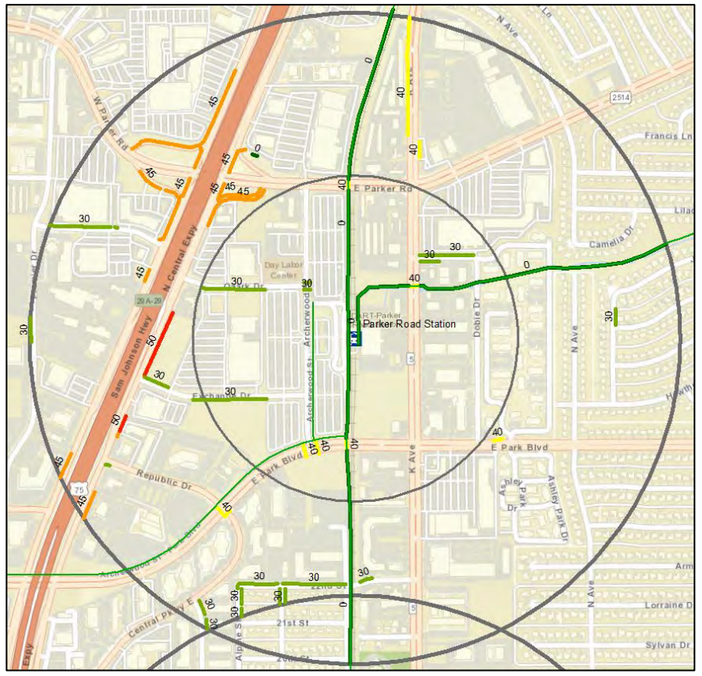
The map shows yellow areas with an above average percentage of low income residents, blue areas with an above average percentage of minority residents, and green areas with an above average percentage of both low income and minority residents. For areas where the map background is visible without any yellow, blue, or green color, no points were scored for the equity criterion. For low income and minority areas (yellow and blue), 3 points were scored for each improvement. For areas with both a higher than average percentage of low income and minority residents (green), 5 points were scored for each improvement.

Gaps to Remain

The consulting team categorized some segments where gaps in the pedestrian network had been identified by NCTCOG during preliminary GIS work to be gaps to remain for the final project listing. This decision was based on field conditions that would be impractical to analyze or would make sidewalk construction extremely cost-prohibitive. Examples include:

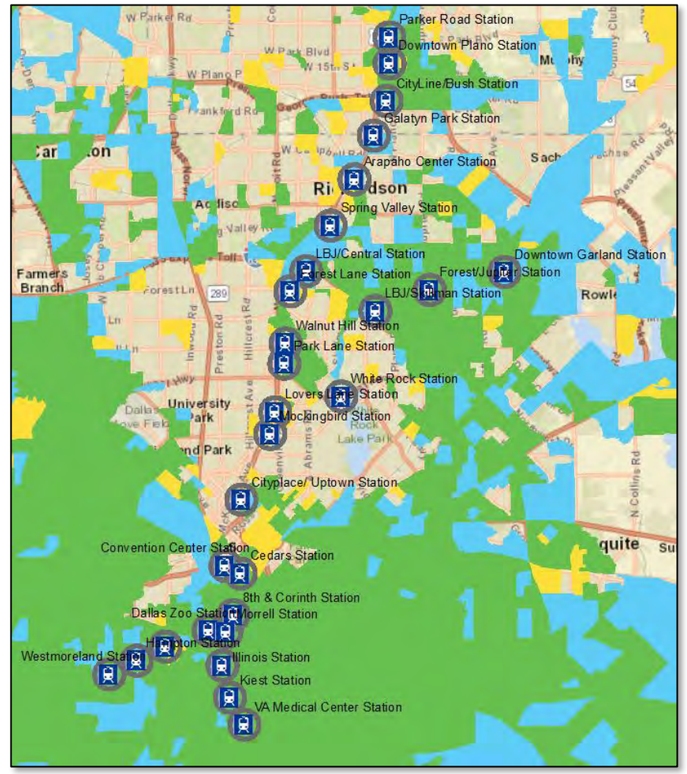
- Segments not connecting to the station without exiting the half-mile area.
- Right-of-way would be needed from a cemetery.
- Widening of existing bridge structures would be required without significant likely pedestrian demand.
- A building structure would need to be removed or modified.
- Parallel pedestrian access is provided a short distance away by a trail or another sidewalk such that new sidewalk adjacent to the street would be redundant.
- Street function is as a fire lane, service drive, or alleyway exclusively for vehicular use and pedestrian access is provided by sidewalk on the opposite side of the building.
- Inadequate space exists for sidewalk between roadway edge and DART tracks, without sufficient right-of-way or spare capacity to recommend a road diet.
- Environmental obstacles such as slopes down to creekbeds.
- Excessive impacts to residential properties (particularly those in older single-family home neighborhoods with very small yards, very short setbacks between the street and home and/or no garages or on-street parking width).
- Locked code-controlled pedestrian gates providing sidewalk access through private property (typically apartment complexes). These were modeled as gaps for the general public while still providing access to apartment residents.
- Sidewalk not needed due to lack of developable adjacent land use and existence of parallel sidewalk on opposite side of street.

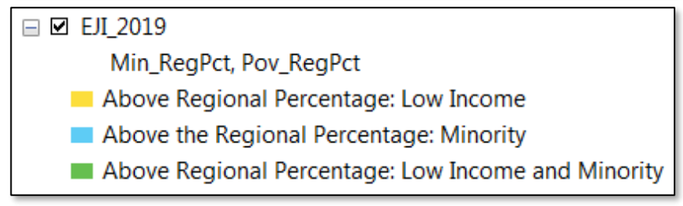
Figure F6: Improvement Scoring by Adjacent or Crossing Posted Speed Limit



- Off-street parking for small businesses blocking the way of sidewalk where parking removal would likely cause significant harm to the business.

Figure F7: NCTCOG Environmental Justic Index Mapping





In most cases where sidewalk obstacles exist, the likely challenges were documented for each improvement in notes designed to guide future planning and selection of improvements for actual projects. In some cases, the obstacles might be overcome by narrowing the roadway pavement or lane widths. If this was deemed potentially feasible, the Gap to Remain category was not used. Only where obstacles were deemed exceedingly challenging or sidewalk was judged highly unlikely to be used by anyone was the Gap to Remain category used.

Prioritization Scoring

Improvements were scored using a Microsoft Excel spreadsheet program and sorted based the overall score. The spreadsheet also summarized information on multiple consecutive GIS sidewalk

Figure F8: Screen Capture (Excerpt) from Improvement Prioritization Spreadsheet

Improvement Number	Distance		Tributary Employment & Population		Trip Length Reduction		Access					Crash History		Systemic Safety		Equity		Total Points	Priority
	Distance	Points	Tributary Emplymt + Population	Points	Trip Length Reduction	Trip Length Reduction Points	Key Destinations (incl. high rider bus stops)	Key Destination Points	Bus Routes	Bus Routes Points	Access Points	Crashes	Points	Speed Limit	Points	EJI	Points

segments on each street block to simplify the resulting improvement tables. Figure F8 shows a screen capture from the Excel spreadsheet for Downtown Plano Station. The figure does not represent a complete listing of all improvements for this station, but is shown for illustrative purposes only. The left-hand column in Figure F8 lists the identifcation number for each improvement.

Consultants evaluated each improvement for the seven criteria described above, as shown by the column headers in the top row of Figure F8. Points were assigned for each improvement based on the values of the reference inputs.

In Figure F8, the partial list of improvements is shown sorted by total points, with possible total values ranging from 0-100 points. The rows of the spreadsheet were color coded based on the priority of the improvement, with dark red for high-priority improvements, orange for medium priority, and light pink for low priority.

APPENDIX G: Cost Estimating Details

DART Station Properties

At NCTCOG and DART's direction, no additional contingencies were provided to account for the pre-design nature of the estimates, made without benefit of survey, subsurface utility investigation, or engineering design practices.

Most engineering projects at early design submittals such as 30% include additional contingencies to account for unknown design details to be addressed later in design. These contingencies are typically lowered with each successive design submission and then minimized by final 100% design submission once all design procedures have been completed.

Without additional contingencies to supplement the preliminary nature of the OPCC's, the uncertainty inherent in this decision was mitigated by a general attempt to be conservative in quantity and unit price estimation. Unit prices and other elements of the OPCC's were developed consistent with the assumptions used for the half-mile areas surrounding each station.

Half-Mile Areas

Opinions of Probable Construction Cost (OPCC) were developed for each high-priority improvement that was not assumed by City staff to be built as part of another project (developer, City, TxDOT, etc.) in the near future.

OPCC's were not developed for *individual* low- or medium-priority improvements, but could be developed by the City in the future based on similar assumptions as outlined below. Rather, estimates for the overall cost of low- and medium-priority improvements were developed on a unit length basis for each station area. The low- and medium priority OPCC estimates are therefore of a lower fidelity and thus the City may consider verifiying them with more detailed individual improvement estimates prior to making further design or construction funding decisions.

The following is a discussion of simplifying assumptions that were made in order to provide quality, yet preliminary OPCC's for the DART Station on-site improvements and nearly 1,100 separate high-priority improvements totalling nearly 58 linear miles over the 28 station areas project-wide.

Table G1 lists the project-wide number and length of improvements *not* assumed to be built by others. The listing is organized by station area, priority and type of improvement (sidewalk/shared use path vs. crosswalk).

Unit Costs

Consultants compared TxDOT and City of Dallas unit prices from recent bid tabulations for various items related to construction of the proposed improvements.

Adjustments were made in the comparisons due to differences in how the specifications, measurement, and payment for the City of Dallas and TxDOT are written. For example, the comparisons were made more balanced by averaging the Dallas values for different spellings of the same item number, or by adding remove and replace items together for comparison with an item that included both in the other agency's specifications.

TxDOT unit prices were in most cases much less expensive for sidewalk related items. This may be because TxDOT is the beneficiary of economies of scale from their contractors on projects of larger size where the items being constructed are contiguous, even though the City on their projects probably builds more sidewalk-related items overall. While this theory is impossible to confirm, since the Dallas prices don't have meta-data like TxDOT does on the quantities and number of times each item was used, the project team felt this effect was most likely present in the data nonetheless.

The City of Dallas bid tabulations also featured a wider array of bid items that would be used in these type of projects compared to the TXDOT standard bid items. Nonetheless, there were some bid items identified from TxDOT that were not available in the City list of bid items. In these cases, or when TxDOT listed a higher, more conservative unit price, the TxDOT items were used for OPCC's for this project.

In all other cases, including for the unit price for sidewalk, City of Dallas unit prices were used. The project team believes that City of Dallas prices would more likely reflect what local contractors would be bidding for sidewalk projects based on size of the proposed construction packages and our experience completing these type of projects in the DFW Metroplex.

Standard Assumptions

The following standard assumptions were used for most OPCC's developed for this project, though exceptions were sometimes made on a case-by-case basis as per engineering judgment.

Facility Width & Alignment

- All new and reconstructed sidewalks were assumed to be 5 feet wide.
- All shared use paths were assumed to be 10 feet wide.
- Sidewalks and shared use paths were assumed to have alignments that could meander slightly around obstacles if necessary and if permitted by the apparent right-of-way width.

Buffer Space & Setbacks

- Reconstructed sidewalk was assumed to be set back from the street where remnants of existing sidewalk had also been set back.
- For new sidewalk, a buffer between the sidewalk and roadway edge was assumed where the apparent available right-of-way seemed to be generally at least 8 feet wide.

Curb & Gutter

- Where sufficient space for buffers did not appear to exist, or where existing, damaged sidewalk that needs to be replaced is attached to the roadway curb, removal and replacement of any existing curb and gutter was assumed to also be necessary, so these costs were also included.
- New curb, gutter, and drainage systems were assumed to be necessary where not existing adjacent to sidewalk gaps.

Retaining Walls

- Retaining walls were estimated to be needed for certain lengths and heights based on engineering judgement where slopes were deemed steep enough to require them.
- Unit costs for retaining walls were estimated based on City of Dallas standard details for short retaining walls and the unit prices for their component features as follows:
  - 1' wall height = $20/linear foot
  - 2' wall height = $40/linear foot
  - 3' wall height = $75/linear foot
  - 4' wall height = $100/linear foot
  - 5' wall height = $125/linear foot

Landscaping

- A two-foot strip of sod was assumed to be needed on each side of the work area in addition to the landscaping allowance noted below.
- Removal and replacement of trees were developed as a blended cost estimate between TxDOT costs for the item "Remove Tree and Install Plant Material" and City of Dallas costs for installing trees.

Driveways

- Standard sizes were developed for assumed reconstruction of residential and commercial driveways where needed to construct level sidewalk crossings. The standard sizes (250 sq. ft. for residential and 500 sq. ft for commercial) helped simplify the task of making variable estimates for hundreds or thousands of driveways project-wide. Instead, estimators needed only to count the number of each type of driveway likely to be affected.
- Greater variability than indicated in the estimates may be expected in the actual construction cost in areas with steeper slopes near driveway crossings.

Table G1: Summary Improvement Statistics by Station Area, Priority & Improvement Type

Total High-Priority Improvements (Sidewalks + Shared Use Paths + Crosswalks) = 1,082
Total High-Priority Improvements (Sidewalks + Shared Use Paths + Crosswalks) = 56.39 miles

Streetlighting

- Where new streetlighting was recommended in conjunction with proposed crosswalk improvements, standard unit prices for the entire installation were developed for different roadway cross sections as follows:

- Two-lane undivided street = $26,500
- Three-lane undivided street = $27,200
- Four-lane undivided street = $40,500
- Four-lane divided street = $41,200
- Six-lane undivided street = $41,900
- Six-lane divided street = $42,700

- For purposes of the OPCC's, streets with medians less than 6' wide were considered undivided, with luminaire poles only on intersection corners rather than mounted in the median.

- For segments of new streetlighting along sidewalk segments on DART property, site-specific streetlighting estimates were developed.

Signals & Beacons at Crosswalks

For crosswalks where proposed traffic signal, Pedestrian Hybrid Beacon (PHB), or Rectangular Rapid Flashing Beacon (RRFB) installations are recommended, the following standard unit prices per installation were developed based on improvement type and roadway cross-section, based on typical recent experience with previous projects:

- RRFB – Three-lane crossing without median island - $24,000
- RRFB – with one solar unit sign with flashers/pushbutton in median refuge island - $36,000
- RRFB – with two solar unit signs with flashers/pushbutton in median refuge island - $48,000
- PHB or Pedestrian Traffic Signal – Three-lane undivided - $150,000
- PHB or Pedestrian Traffic Signal – Four-lane divided - $175,000
- PHB – Six-lane divided - $200,000
- Pedestrian Traffic Signal – Six-lane divided - $210,000
- Add APS pushbuttons, countdown pedestrian heads at existing signal - $3,500 per intersection + $6,000 per crosswalk

Road Diets

- Where road diets are recommended to provide shorter pedestrian crossings and/or provide space for pedestrian amenities such as median refuge islands and posts for signs, beacons and/or pushbuttons, the recommendations are made for consideration with the understanding that further, corridor-wide analysis outside the scope of this project will be required.

- The costs estimated are for making changes within a block in either direction of the pedestrian crossing, which would likely be the minimum viable improvement. In many cases, cities may consider a longer corridor for road diet implementation if spare capacity for auto traffic along the route is confirmed. However, costs associated with additional project length, or other costs associated with reconstructing curbs and islands beyond the one-block transition area or changes to signalized intersections, have *not* been included since they would difficult to estimate without additional study.

Median Anti-Climb Fencing

At a few locations where eliminating barriers to more direct pedestrian travel was determined to be impractical, aesthetic, anti-climb fencing is recommended to channelize pedestrians to the safest street crossings a reasonable distance away. City of Dallas and TxDOT standard bid items were found to be insufficient to account for this type of fencing. Consultants identified two aesthetic, anti-climb fencing system products and requested pricing information on each from vendors and contractors. Photographs of the types of fencing available have been included in the figures shown previously for the relevant locations.

Criteria in identifying a suitable type of fencing for these applications were that it be tall enough and without hand or finger holds to allow it to be climbed. Also, since several systems would be installed in close proximity to moving traffic, it should either be crashworthy as a stand-alone installation or capable of being mounted on crash-tested standard median concrete traffic barrier.

One type of custom fencing identified had been built in recent years along the relatively narrow median of a high-speed state highway near touristed beach areas in Ocean City, Maryland. Consultants spoke with the vendor who provided the fencing and the contractor who built it. It was built to resemble a white picket fence, with pointed bars at the top to discourage climbing. The fencing was mounted on breakaway supports and a specially designed concrete foundation for wind loading in an area prone to hurricanes.

The contractor indicated the bid cost for this fencing was about $440 per linear foot, which included all miscellaneous related items such as mobilization and temporary traffic control. The same wind load and foundation design would not likely be required for fencing in North Texas, but it isn't clear how much cost savings might be achieved with this change.

The contractor did not have examples of this type of fencing being built on top of concrete traffic barrier that would reduce the maintenance requirements for the fencing. If struck by errant vehicles traversing the curbed median, a significant amount of labor would be involved in replacing damaged sections.

The other type of fencing system identified was the ClearVu Invisible Wall system from Cochrane USA. This system was used as median pedestrian fencing in a recent project by TxDOT in the City of Fort Worth on Lancaster Ave. Quotes for fencing systems were obtained from Cochrane USA for the specific locations recommended for this proejct. Pricing varied from $52 to $73 per linear foot for the entire system, depending mostly whether the fencing was to be installed on ground mounted posts in wide medians or away from roadways or on top of concrete traffic barriers in narrow medians.

For the Lancaster Ave project, where a wide median was available, TxDOT indicated that bid prices including contractor labor for the project were about $90 per linear foot. However, a representative from the contractor was also contacted and indicated that he would bid a higher price of $130 to $140 per linear foot for future contracts. Their experience after installing the fencing for the first time was that it was a labor-intensive process that would not go more quickly with additional experience. Another local contractor who has installed this type of fencing on other projects indicated a typical bid price of $110 to $120 per linear foot.

After reviewing the above information, consultants decided on a unit cost of $130 / linear foot for anti-climb pedestrian fencing. This was based on 6' high fencing for stand-alone applications, or 3.5' fencing on top of 2.5' tall concrete traffic barrier for a total barrier height of 6' in narrow median applications. The $130 per linear foot value provides for a relatively generous extra labor allowance for the Clearview Invisible Wall system and/or for vendors of other similar products to be identfied.

Where median anti-climb fencing is recommended on top of concrete traffic barrier, standard TxDOT bid items for constructing concrete traffic barrier and end treatments were assumed independent of the cost of the remainder of the fence.

Right-of-Way

- No right-of-way acquisition is assumed for any improvements. Right-of-way data was unavailable for the high-level planning purposes of this study. Some assumptions about the apparent right-of-way location were made based on factors such as the location of utility poles in order to make other assumptions necessary for cost estimation.

- Some improvements on private property (such as that of hospitals or other large employers) assume that cooperation of the property owners and negotiation of easements would be necessary. However, no additional cost has been assumed for these activities.

Contingencies

The following contingencies (totaling 25%) were applied to all costs, as directed and approved by both NCTCOG and DART:

- 10% design fee
- 4% mobilization
- 4% for landscaping allowance
- 2% for Erosion & Sediment Control Allowance
- 3% for traffic control
- 2% extra contingency for federal aid project

At NCTCOG and DART's direction, no additional contingencies were provided to account for the pre-design nature of the estimates, made without benefit of survey, subsurface utility investigation, or engineering design practices.

Most engineering projects at early design submittals such as 30% include additional contingencies to account for unknown design details to be addressed later in design. These contingencies are typically lowered with each successive design submission and then eliminated at final 100% design submission once all design procedures have been completed.

Without additional contingencies to supplement the preliminary nature of the OPCC's, the uncertainty inherent in this decision was mitigated by a general attempt to be conservative in quantity and unit price estimation, as already discussed.

North Central Texas Council of Governments
DART Red & Blue Line Corridors Last Mile Connections

Location ID	Ownership	Project Type	Description	Opinion of Probable Cost
1C-CB-ST-01	DART	Tourist Sign Relocation	The Dallas tourism "BiG" sign on Routh West Dr just south of the station should be reversed to face the opposite direction or the sign should be relocated to a safer position. The sign faces the street, a poor orientation since those taking photographs of others posing at the sign will be tempted to stand in the travel lanes.	$ 900
1C-CB-ST-02	DART	ADA Ramp Adjustment	Widen the ADA ramp to Routh West Dr from the south end of the platform to allow wheelchair users to bypass the large vine sculpture blocking the top of the ramp.	$ 2,800
1C-CB-ST-04	DART/City of Richardson	Warning Signs & Ramps	Add pedestrian warning signs on the right-hand side of the roadway at the six crosswalks to the station platform across Routh East Dr and Routh West Dr. Existing signs are mounted on the left-hand side only. (The signs on the west side of Routh West Drive would be on City of Richardson property, but the signs on the east side of Routh East Drive would be on DART property). Add missing ADA ramps at two of the same locations. Of the total $10,400 cost listed at right, half is assumed attributable to DART and half to City of Richardson.	$ 10,400
1C-CB-ST-07	DART/ TxDOT/ City of Plano	Sidewalk, Crosswalk Signs & Markings, PHB	Construct a new, short segment of sidewalk on the west side of the Crawford Rd/Topridge Dr crossing under the PGBT, near the north end of the underpass adjacent to the PGBT westbound frontage road (WBFR). Add marked, signed crosswalks across the east and west legs of the WBFR. The existing sidewalk on the west side extends north from the PGBT eastbound frontage road (EBFR), but ends just south of the WBFR. These crosswalks would provide added conspicuity for pedestrians who decide crossing at the signal proposed at Location 8 would be too far out of their desired travel path. Provide pedestrian hybrid beacon with advance "Yield Here to Pedestrians" signing for crossing PGBT westbound frontage road. Cost amount shown at right (1/3 of overall cost) is assumed shared responsibility by DART, with remainder by TxDOT and City of Plano. See half-mile area improvements 1C-CB-CW-042 and 1C-CB-CW-043 for more details and cost information.	$ 63,000
1C-CB-ST-08	DART/ City of Plano/ City of Richardson	Sidewalk	Construct new sidewalk on the east side of the Crawford Rd/Topridge Dr crossing under the PGBT between the PGBT westbound frontage road (WBFR) and eastbound frontage road (EBFR). Cost amount shown (1/3 of overall cost) is assumed shared responsibility by DART, with remainder by the Cities of Plano and Richardson. See half-mile area improvement 1C-CB-CW-056 for more details and cost information.	$ 13,100
1C-CB-ST-09	DART/ TxDOT/ City of Richardson	Crosswalk Signs & Markings, PHB	Add a crosswalk across the east leg of the PGBT Eastbound Frontage Road (EBFR) at Topridge Dr. Provide pedestrian hybrid beacon with advance "Yield Here to Pedestrians" signing. See also half-mile area improvement 1C-CB-CW-059. Cost amount shown (1/3 of overall cost) is assumed shared responsibility by DART, with remainder by TxDOT and/or City of Richardson. See half-mile area improvement 1C-CB-CW-056 for more details and cost information.	$ 59,000
Opinion of Probable Cost - DART/Mixed Ownership Subtotal (DART Portion of Costs Only)				$ 144,000
Opinion of Probable Cost - City of Richardson Subtotal				$ 5,200
1C-CB-ST-03	DART/ Private Property	Sidewalk	Coordinate with the adjacent property owner to add a direct sidewalk connection between train platform & bus loop. A worn path in the grass ("goat trail)" exists between the southwest corner of the Alexan Central Apartments dog park on Pipeline Dr and the DART bus stops along the PGBT eastbound frontage road. This is the most direct route between the train station platform and the bus stops, shorter than walking north along Routh West Dr and the frontage road. See off-site improvement 1C-CB-CW-071. No assumed cost responsibility by DART.	$ -
1C-CB-ST-06	DART/ Private Property	Sidewalk	Coordinate with the adjacent property owner to construct a short segment of sidewalk for more direct travel between the southern crosswalk to the train platform and the south sidewalk along State St. A "goat trail" cuts the corner where the existing sidewalk is offset from the crosswalk, indicating existing pedestrian demand. See off-site improvement 1C-CB-CW-044. No assumed cost responsibility by DART.	$ -
Opinion of Probable Cost - DART/Private Property Subtotal				$ -
1C-CB-ST-05	TxDOT	Sidewalk repair	Repair the sidewalk panel where settlement has created a trip hazard near the pedestrian pushbutton on the north side of the President George Bush Turnpike (PGBT) eastbound frontage road at Routh West Dr.	$ 3,400
1C-CB-ST-10	TxDOT	Add Traffic Signal with Crosswalk Markings	Coordinate with TxDOT to add signalized crosswalk across the PGBT WBFR just east of the track crossing. This crosswalk will provide safer access to the DART station for residents of the apartments on the north side of the westbound frontage road. See off-site half-mile area improvement 1C-CB-CW-045 for more details. This improvement is being constucted as part of the Silver Line Project.	$ -
Opinion of Probable Cost - TxDOT Subtotal				$ 3,400
General	---	Pedestrian Ramps	Many pedestrian ramps in the station area are missing detectable warning surfaces, which should be added.	N/A
Opinion of Probable Cost - Total for All Recommendations at Station				$ 152,600

APPENDIX I: Half-Mile Area Recommendation Details & Detailed Improvement Mapping

Figures 1C-3 through 2C-4 on the following pages of this appendix identify existing conditions and recommended improvements for the half-mile areas around each station in Richardson. The first figure in each set indicates existing conditions and the second figure indicates the recommended improvements.

In each figure, existing sidewalks are shown in light blue, as well as Regional Veloweb shared use paths (bright green) and local shared use paths (dark green). Existing shared use paths are shown with solid lines, while proposed shared use paths are shown in dashed lines.

The density of individual parcels' population plus employment totals are shown in a multi-color scale on the existing conditions figure. The population and employment density is shown in grayscale on the recommended improvements figure to allow the improvements to stand out more clearly.

Sidewalk and crosswalk gaps are shown in red on the existing conditions figures, and in multiple colors on the recommended improvements figures, according to the priority assigned to the gap: red for high-priority, orange for medium-priority, and light pink for low-priority. Gaps to remain are shown in dark pink. For more details on these gap categories, refer to Appendix F.

Each high- medium- and low-priority improvement, along with all gaps to remain, are indicated by the boxed number labels near each improvement location. The lower right corner of each recommended improvements figure includes a legend that describes the abbreviations in the improvement ID codes, which can be used to cross-reference the improvement matrices that appear in Appendix J.

For solid red, orange, or light pink lines, the recommended improvement for a sidewalk gap is either a new or repaired 5-foot wide sidewalk along the length shown. Repairs are noted in the matrix notes for each improvement in Appendix J, and assume full removal of damaged, existing sidewalk prior to replacement.

Note that in some places dashed green lines for planned shared use paths appear on top of other colored lines. Where dashed green lines appear on top of light blue lines, this indicates that a sidewalk of adequate width exists for basic pedestrian connectivity, and that a wider shared use path is also planned in the future. Such "sidewalk widening" improvements were ***not*** considered essential to provide multi-modal connectivity to transit for the purposes of this project, and as such were not listed as numbered improvements or included in any cost estimation of high-priority improvements. They are shown on the map figures for informational purposes only.

Other dashed green lines in the existing conditions and recommended improvements figures appear on top of red, orange, or light pink lines. On the existing condtions figures, dashed green over red indicates a gap where no current sidewalk or shared use path exists but a future local or regional shared use path is planned. On the recommended improvements figures, dashed green over red, orange, or light pink also indicates a gap (of the priority indicated by the non-green color) where no current sidewalk or shared use path exists but a future local or regional shared use path is planned. In these cases, 10'-wide shared use paths ***were*** considered essential as high-priority improvements (dashed green over red) to provide multi-modal connectivity to transit, and as such were listed as numbered improvements and included in the cost estimates that follow.

For crosswalk gaps, the type of improvement recommended is shown with numbered dark blue circles located near each crosswalk. The numbers in the blue circles correspond to the legend of possible pedestrian safety countermeasures appearing at the upper right of the figure. The first nine items in this legend correspond to the standard nine items in Table 1 of FHWA's publication, "Guide for Improving Pedestrian Safety at Uncontrolled Crossing Locations," referenced earlier in Section 2.6, Appendix C, and Appendix D. Treatments recommended somewhere on a particular figure have a red box around them in the legend for easier reference.

The right-hand side of each existing and recommended improvements figure includes a legend for "Primary Routes." These are street segments identified by NCTCOG as candidates for further evaluation during preliminary analyses that preceeded the subject project by the consultant team. Primary Routes are denoted with a darkened black street centerline and a letter designation matching a street name indicated in the legned. Comparing the primary routes with high priority gaps on the recommended improvements figures illustrates differences between the results of this preliminary methodology with the final methodology.

The "Half Mile Area Improvements Matrices" appearing in Appendix J for each station list for each improvement the owner, improvement type, location, length, notes, priority score, and (in the case of high priority improvements not built by others) the opinion of probable construction cost. A matrix for sidewalks and shared use paths appears first, followed by a second matrix for crosswalks sorted separately. Each of the matrices is sorted by ownership and then by ID number.

The notes discuss any observations from the field visits deemed relevant, as well as challenging conditions the City and other agencies may want to consider when advancing recommended projects to design and/or construction. This type of information captured in the notes was a primary component of developing the quantities that form the basis for the opinions of probable construction cost. Also included in the notes (where provided) is feedback received from the City about upcoming projects or development that may construct the improvement. The absence of a note indicates that the sidewalk improvement appears to be relatively straightforward without obvious challenges.

In some cases, ownership of or responsibility for improvements was assumed to be shared among agencies, such as for a sidewalk crossing the Plano/Richardson City boundary or for a crosswalk from DART property across an adjacent City street. Such mixed ownership cases appear at the end of each listing with separate OPCC subtotals. In these cases, the OPCC for individual improvements or groups of improvements was split equally among each agency in the summary tables that follow in the main body of the report.

CityLine Bush Station

Figure 1C-3 illustrates the existing conditions in the half-mile area around the CityLine Bush Station. Central Expy (U.S. 75), the President George Bush Tpk (SH 190) and K Ave/N Plano Rd all pose boundaries to multi-modal access to the station. While the station is located just south of the Richardson City line formed by the PGBT, new transit-oriented residential development has occurred north of the PGBT in Plano, with other undeveloped parcels expected to bring more such development. The current configuration of the Park & Ride lots located below the PGBT bridge

structures is oriented primarily to serve DART riders driving to the station, with fewer accomodations for pedestrian and bicycle trips through the large parking lots.

Figure 1C-4 shows the recommended improvements in the half-mile area around the CityLine Bush Station. Several sidewalks and connecting crosswalks should be built through and around the Park & Ride lots below the PGBT bridges. The high posted speed limits along the PGBT frontage roads create the need for high-visibility crosswalks. Therefore, pedestrian hybrid beacons are recommended at the Crawford Rd/Topridge Dr crossings of the PGBT frontage roads (1C-CB-CW-42, 1C-CB-CW-43, and 1C-CB-CW-59). Also, a pedestrian traffic signal is recommended for the crossing of the PGBT westbound frontage road just east of the DART tracks (1C-CB-CW-45). The existing crosswalk across the WBFR west of the tracks will be removed as part of the Silver Line Construction, which is still under design but will reconfigure other existing sidewalks and crosswalks in and around the station.

Three existing signalized intersections should receive pedestrian access improvements. Marked crosswalks and countdown, accessible pedestrian signals should be added at the intersections of Plano Pkwy with F Ave/Executive Dr and with K Ave. Though pedestrian indications are already present at the K Ave/N Plano Rd intersection with the PGBT frontage roads, sidewalks (1C-CB-SW-046, 1C-CB-SW-047, and 1C-CB-SW-061) need to be added so that pedestrian travel through these intersections can occur during all weather and for DART riders of different abilities.

Most of the recommended improvements south of the station in Richardson are anticipated for construction by others, either as part of the Silver Line project or the ongoing construction of the CityLine mixed-use development.

A shared use path as part of the Regional Veloweb is funded as part of the construction of the Silver Line Project. The shared use path will parallel the track alignment, on the east side of the tracks north of the station and curving to the west south of the station to cross under Central Expy (U.S. 75). Connecting trails will need to be provided to link the shared use path to other shared use paths planned by the City of Richardson and TxDOT along the U.S. 75 frontage roads. From CityLine Dr to Renner Rd, the local shared use path on the east side of U.S. 75 is funded.

Other shared use paths are planned by the City of Richardson along the south side of the PGBT eastbound frontage road and along the west side of N Plano Rd. In some places the shared use path would widen existing sidewalk, while in other places it would fill a gap where no existing sidewalk is present.

Additional details about other improvements recommended in Figure 1C-4, as well as challenges associated with the recommended gaps to remain, are included in the matrix notes for CityLine Bush Station that can be found in Appendix J.

Galatyn Park Station

Figure 2A-3 illustrates the existing conditions in the half-mile area around the Galatyn Park Station. Central Expy (U.S. 75) currently blocks all bicycle and pedestrian travel to and from the west since the only bridge that crosses it within the half-mile area, on Galatyn Pkwy, does not include sidewalk. A DART shuttle (Route 824) connects the station to areas west of U.S. 75 at 15- to 20-minute intervals during weekday peak hours. This route previously included more expanded hours of operation, but service has been scaled back due to COVID-19 travel demand changes.

The Central Trail, part of the Regional Veloweb shared use path network, runs along the east side of the DART right-of-way along its entire length within the half-mile area. On-street bike lanes are present along N Collins Blvd throughout the half-mile area. Local shared use paths exist or are planned farther west on either side of Prairie Creek. To the northeast of the station, a local shared use path that is partially complete along the north side of Glenville Dr is planned by the City of Richardson to extend to the intersection with Lookout Dr, where it will continue along the north side of Lookout Dr to points eastward.

Figure 2A-4 shows the recommended improvements in the half-mile area around the Galatyn Park Station. The City of Richardson should consider improved bicycle and pedestrian access across U.S. 75. Many pedestrians and cyclists would likely prefer the increased convenience of a sidewalk connection over the 15- to 20-minute intervals provided by DART Bus Route 824, even after the return of mid-day bus service. A sidewalk connection would also be available at night or on weekends.

The Galatyn Pkwy bridge over U.S. 75 is currently posted with a "No Pedestrians" prohibition. The bridge would either need to be widened to provide sidewalk, or a road diet would need to be implemented. Between the ramp signals, about 44 feet is allocated to four travel lanes. Narrowing lanes from 11 feet wide to 10 feet wide could provide space for a minimal 4-ft wide sidewalk on one side of the bridge only.

A better alternative for a road diet may be to reconsider the lane geometry of the tight-diamond interchange. Northbound and southbound vehicular through movements from the ramps are unnecessary and can be eliminated because the frontage roads provide through movements underneath the Galatyn Pkwy Bridge that does not require crossing Galatyn Pkwy at-grade via the ramps. With elimination of the through movements, the interchange could potentially be converted to a diverging diamond interchange (DDI) configuration with a single lane in each of the eastbound and westbound directions.

This configuration would require a median, but sidewalk could then be provided either along one side of the bridge or (as is relatively common in the DDI configuration) in the median between opposing lanes, each traveling in a counterflow direction. Geometric studies would be needed to see if such a configuration, including required signal displays, could fit on the existing bridge structure, while capacity analysis would be needed to evaluate the strategy's operational effectiveness relative to existing and projected future conditions with build-out of adjacent developments. However, despite the expectation of increased development and auto traffic in the area, the concept holds potential, since DDI's frequently outperform traditional tight diamond interchanges like the existing configuration by a large margin and/or with fewer lanes.

Drainage would need to be modified on the west bridge approach to add sidewalk, since grate inlets are present along the curb. On the east bridge approach, narrowing lanes from 11 feet wide to 10 feet wide (along with narrowing and realigning of the roadway median) could provide some of the space needed for new sidewalk, with additional space coming from the potential changes to lane configurations and phasing at the signalized interchange of Galatyn Pkwy with the U.S. 75 ramps.

In addition to new sidewalk in some locations to fill network gaps, other recommended improvements include:

Improvement Code Legend (See Matrix)
2A-GP-SW-01
2A ← Station Number
GP ← Station Abbreviation
SW ← Sidewalk (or CW for Crosswalk)
01 ← Improvement Number (Matches 1 on Map)

- New crosswalks with rectangular rapid-flashing beacons (RRFB's) for crossing Glenville Dr at two locations (improvement 2A-GP-CW-67 and 68) across a long stretch where the street has no other controlled crossings. The northern location would connect existing sidewalk from the station to the Infosys corporate campus, but would require coordination with the private property owner to extend sidewalk to the building front doors.
- Marked crosswalks and pedestrian ramps to cross N Collins Blvd at Palisades Creek Dr, a wide crossing of an all-way stop-controlled intersection (improvements 2A-GP-CW-08 and 09).
- New signed, marked and lit crosswalks at the intersection of N Collins Blvd and Fall Creek Dr (improvements 2A-GP-CW-12 and 13). Add yield lines and "Yield Here to Pedestrians" signing in each direction approaching crosswalk to mitigate risk of dual threat situation for pedestrians. Consider additional improvements if a study of pedestrian volumes warrants them, given the long distance to stop-controlled crossing locations in either direction.
- Marked, signed, and lit crosswalks across Palisades Blvd at South Gate Dr (improvements 2A-GP-CW-26 and 27). Consider curb extensions or a median refuge island in the wide 34-ft roadway. Care should be taken to provide advance warning signs in the eastbound direction due to the crest vertical curve in the roadway to the west. Or, the potential also exists for revising traffic signage to make the north-south route primary. In addition, the Palisades master plan does include the possibility of Palisades Blvd abandonment east of Empire Dr.
- Pedestrian or bicycle/pedestrian warning signs and white crosswalk lines parallel to the existing crosswalks for the Central Trail crossings of N Glenville Dr, E Lookout Dr, and Lakeside Blvd and at the intersection of E Lookout Dr and Performance Dr (improvements 2A-GP-CW-45, 55-57, and 78). The existing crosswalks have a faded, non-conforming brick pattern and dark outlines. White edge lines as traffic control devices are required to make crosswalks legally enforceable. Add yield lines and "Yield Here to Pedestrians" signing in each direction approaching the crosswalks across N Glenville Dr and at the intersection of E Lookout Dr and Performance Dr to mitigate the risk of a dual threat situation for pedestrians.
- A marked crosswalk at the existing signed pedestrian crossing across E Lookout Dr midway between Performance Dr and N Glenville Dr (improvements 2A-GP-CW-58). Add yield lines and "Yield Here to Pedestrians" signing in each direction approaching the crosswalk to mitigate the risk of a dual threat situation for pedestrians.
- Marked crosswalks at the existing signed pedestrian crossing across Lakeside Blvd between Central Trail and Waterwood Dr (improvement 2A-GP-CW-80). Add yield lines and "Yield Here to Pedestrians" signing in each direction approaching the crosswalks to mitigate the risk of a dual threat situation for pedestrians.
- White edge lines on the outside of brick crosswalks at the roundabout entries and exits where Lakeside Blvd intersects Lawnview Dr (improvements 2A-GP-CW-81, 82 and 85). White edge lines as traffic control devices are required to make crosswalks legally enforceable. Also, the only way to reach the roundabout crosswalks from adjacent sidewalks is via stairs to/from the sidewalks above. Explore alternatives for ADA-compliant access, and add pedestrian ramps at each crosswalk.
- A marked crosswalk at the existing signed pedestrian crossing across Lakeside Blvd mid-block between Lawnview Dr and the southern study boundary (improvement 2A-GP-CW-83). Add yield lines and "Yield Here to Pedestrians" signing in each direction approaching the crosswalk to mitigate risk of dual threat situation for pedestrians.

Many missing sidewalks will be constructed by the Palisades development as it is completed just west of Central Expy and the station. The developer will bear the cost for these improvements.

Additional details about other improvements recommended in Figure 2A-4, as well as challenges associated with the recommended gaps to remain, are included in the matrix notes for Galatyn Park Station that can be found in Appendix J.

Arapaho Center Station

Figure 2B-3 illustrates the existing conditions in the half-mile area around the Arapaho Center Station. Central Expy (U.S. 75), Collins Blvd, and Arapaho Rd are all arterials that provide barriers to multi-modal travel to and from the station. Due to a lack of street and intersection density in the areas east of the station, multi-modal travel to and from that direction is significantly more circuitous, and a large number of auto-oriented businesses and offices with large parking lots also impede connectivity.

The Central Trail provides multi-modal access along the east side of Greenville Ave north of the station, switching to the west side of Greenville Ave south of the station via the tunnel between the train platform and the park & ride lot/bus loop. A local shared use path is present along the west side of Alma Rd from Collins Blvd to Woodall Dr, while on-street bike lanes are provided along both Greenville Ave and Alma Rd for the length of the study area, as well as along Collins Blvd east of Alma Rd.

Figure 2B-4 shows the recommended improvements in the half-mile area around the Arapaho Center Station. Coordination between the City, DART, and adjacent private property owners would be required to construct a sidewalk connection southwest of the train platform to connect more directly to the U.S. 75 northbound frontage road and the businesses located there (improvement 2B-AC-SW-37). Also highly recommended is the construction of sidewalk fronting several of those businesses farther south (improvement 2B-AC-SW-37).

A shared use pathway as part of the Regional Veloweb network is planned along the Kansas City Southern rail line entering the north part of the study area and connecting to Collins Blvd west of U.S. 75 (improvement 2B-AC-VW-V01). A sidewalk connecting this improvement and the existing sidewalk along the west side of Collins Blvd to the sidewalk along the U.S. 75 southbound frontage road should be constructed as well (improvement 2B-AC-SW-03).

The City of Richardson is planning local shared use paths along the south side of Arapaho Rd west of Greenville Ave and along the Kansas City Southern freight rail line southeast from its crossing of Alma Rd. On-street bike lanes are planned for Collins Blvd west of Alma Rd and across the bridge over U.S. 75. The City of Richardson plans to implement a road diet on the Collins Blvd bridge that will allow for wider sidewalks and protected bike lanes. The project should include signed and marked crosswalks with pedestrian-actuated rectangular rapid-flashing beacons (RRFB's) for crossing each of the four ramps between Collins Blvd and the U.S. 75 frontage roads, since the geometry of these ramps is conducive to high vehicular speeds.

Two new crosswalks are recommended for crossing Richardson Dr. One is recommended south of Monte Blaine Ln (improvement 2B-AC-CW-53), where the existing sidewalk on the west side ends and the City's zoning code precludes removal of hedges from a narrow space to the south. The hedges provide necessary screening and would need to be removed to add sidewalk (improvement 2B-AC-CW-55), so the crosswalk will provide an alternate route via new and proposed sidewalk on the west side. The other crosswalk location (improvement 2B-AC-CW-53) aligns with an existing break in the hedges that aligns with the east end of Jolee St (which does not connect for car traffic to Richardson Dr).

Both crosswalks must be designed carefully to maximize sight distance around the hedges and the tree-lined horizontal curves in the roadway geometry. Both should include yield lines and "Yield Here to Pedestrians" signing in each direction to mitigate risk of dual threat situation for pedestrians. Give strong consideration to installing pedestrian-actuated rectangular rapid flashing beacons (RRFB's), particularly due to the sight distance limitations. A road diet to introduce curb extensions and/or a median refuge island for pedestrians might also be considered to increase available pedestrian sight distance.

Additional details about other improvements recommended in Figure 2B-4, as well as challenges associated with the recommended gaps to remain, are included in the matrix notes for Arapaho Center Station that can be found in Appendix J.

Spring Valley Station

Figure 2C-3 illustrates the existing conditions in the half-mile area around the Spring Valley Station. U.S. 75, Spring Valley Rd, and Centennial Blvd are major arterials that pose barriers to bicycle and pedestrian travel, though signalized crossings generally provide good access opportunities. Access to the transit-oriented development east of the station is good with new sidewalk, though somewhat indirect. The area west of U.S. 75 is only accessible to the station by traveling south along the southbound frontage road to the intersection with Spring Valley Ln, slightly outside the study half-mile area. Several gaps in the sidewalk are present along the U.S. 75 frontage roads and along the neighborhood streets east of Greenville Ave.

The Central Trail runs parallel to the DART track on the east side to the north of the station and crosses under the DART overpass just south of Spring Valley Rd to an alignment west of the tracks south of the station to Buckingham Dr.

Figure 2C-4 shows the recommended improvements in the half-mile area around the Spring Valley Station. In addition to building sidewalk to fill gaps in the network, the recommended improvements include:

- At the west end of McKamy Springs Ct, consider providing short break in the existing fence to provide a sidewalk connection to the Central Trail. This would require removal of a short section of fence and part of a short retaining wall, as well as a few medium-sized trees, but would provide a shorter walking distance to the station for many apartment and townhome residents to the east. The City of Richardson indicates they will need to work with the property owner on whether they have a desire for this improvement.
- New or improved crosswalks across Lingco Dr between the station platform and park & ride lot, across Sherman St at Lingco Dr, and across Greenville Ave at Pittman St (improvements 2C-SV-CW-16, 17 and 38). Yield lines, "Yield Here to Pedestrians" signing, and a pedestrian refuge island are recommended at the Lingco Dr and Greenville Ave crossings, while pedestrian-actuauted RRFB's are recommended at Lingco Dr. The Lingco Dr crossing should be coordinated with DART, as discussed in Section 3.1.4.
- New yield lines and "Yield Here to Pedestrians" signing for the two lanes in each direction approaching the existing signed and marked crosswalk across Greenville Ave at E Phillips St, near the northeast half-mile area boundary (improvements 2C-SV-CW-30 and 31). Consider adding a pedestrian hybrid beacon if warranted by a study of pedestrian volumes during arrival and dismissal times for the First Baptist Church of Hamilton Park and the Richardson ISD Math Science Technology magnet school, both located nearby to the east.
- White crosswalk lines parallel to the existing patterned concrete crosswalk across Bucknghamm Rd at the Central Trail crossing (improvement 2C-SV-CW-27), which already has lighting, pedestrian ramps and a median refuge. White edge lines as traffic control devices are required to make crosswalks legally enforceable. Add pedestrian warning signs at the crosswalk and advance pedestrian warning signs for the eastbound direction (currently installed only for westbound). Add yield lines and "Yield Here to Pedestrians" signing for both directions to mitigate the risk of a dual threat situation for pedestrians. Consider a traffic signal to facilitate crossings, particularly in conjunction with the future extension of the Central Trail south of Buckingham Rd at this location. A full traffic signal should be considered instead of a RRFB or pedestrian hybrid beacon due to the adjacency to the existing DART railroad crossing gates and potential driver confusion with alternative meanings of flashing red lights.

As discussed in Section 3.1.4, some pedestrians were observed crossing Spring Valley Rd, a busy six-lane arterial, directly below the rail overpass instead of at the adjacent signalized crosswalks at Lingco Dr 200 feet to the west or Spring Valley Rd 200 feet to the east. The alignment of the Central Trail, which intersects the Spring Valley Rd sidewalks here without a direct crosswalk, likely contributes to this behavior. A crosswalk improvement for more direct pedestrian travel along the trail would pose an undue constraint on vehicular signal coordination given the short distance to the signalized crosswalks. The City of Richardson should coordinate with DART to consider adjusting the location of bus stops and installing aesthetic anti-climb median fencing (improvement 2C-SV-GR-25) along the median of Spring Valley Rd in front of the DART station to ensure pedestrians cross at the crosswalks.

The City of Richardson is planning to widen the sidewalk on the north side of Spring Valley Rd west of the station to become a shared use path on the Regional Veloweb network. East of the station, the sidewalk on the north side would also be widened for a local shared use path that continues to Greenville Ave and along the west side of Greenville Ave north of Spring Valley Rd. The Central Trail is planned to be extended south of Buckingham Dr parallel to the DART tracks on the east side.

Additional details about other improvements recommended in Figure 2C-4, as well as challenges associated with the recommended gaps to remain, are included in the matrix notes for Spring Valley Station that can be found in Appendix J.

2A-GP-SW-42	TxDOT	New Sidewalk	Galatyn Pkwy	N Central Expy SB Ramps & N Central Expy NB Ramps	North	315	The Galatyn Pkwy bridge over U.S. 75 is currently posted with a "No Pedestrians" prohibition. The bridge would either need to be widened to provide sidewalk, or a road diet would need to be implemented. Between the ramp signals, about 44 feet is allocated to four travel lanes. Narrowing lanes from 11 feet wide to 10 feet wide could provide space for a minimal 4-ft wide sidewalk on one side of the bridge only. A better alternative for a road diet may be to reconsider the lane geometry of the tight-diamond interchange. Northbound and southbound vehicular through movements from the ramps are unnecessary and can be eliminated. The interchange could then potentially be converted to a diverging diamond interchange (DDI) configuration with a single lane in each of the eastbound and westbound directions. This configuration would require a median, but sidewalk could then be provided either along one side of the bridge or (as is relatively common in the DDI configuration) in the median between opposing lanes, each traveling in a counterflow direction. Geometric studies would be needed to see if such a configuration, including required signal displays, could fit on the existing bridge structure, while capacity analysis would be needed to evaluate the strategy's operational effectiveness relative to existing and projected future conditions with build-out of adjacent developments.	47	$2,211,500
2A-GP-GR-43	TxDOT	Gap to Remain	Galatyn Pkwy	N Central Expy SB Ramps & N Central Expy NB Ramps	South	310	The Galatyn Pkwy bridge over U.S. 75 is currently posted with a "No Pedestrians" prohibition. The bridge would either need to be widened to provide sidewalk, or a road diet would need to be implemented. Since bridge widening is presumed impractical, and some possibility for a road diet to provide sidewalk on the north side of the bridge may exist, it is assumed no sidewalk will be provided on the south side.	0	N/A
2A-GP-SW-46	TxDOT	New Sidewalk	N Central Expy	N Glenville Dr & E Lookout Dr	East	615	A worn path in the grass indicates existing pedestrian demand. Utilities present but mostly avoidable along vacant parcel. Fill may be needed to elevate sidewalk outside low-lying areas that would present a drainage problem. Sidewalk will be added during the construction of the recently approved hotel at this location.	26	N/A

2A-GP-CW-08	City of Richardson	New Crosswalk	N Collins Blvd	Palisades Creek Dr	North	95	Add marked crosswalks and pedestrian ramps to cross N Collins Blvd at these wide crossings of an all-way stop-controlled intersection.	15	N/A
2A-GP-CW-09	City of Richardson	New Crosswalk	N Collins Blvd	Palisades Creek Dr	South	95	Add marked crosswalks and pedestrian ramps to cross N Collins Blvd at these wide crossings of an all-way stop-controlled intersection.	16	N/A
2A-GP-CW-12	City of Richardson	New Crosswalk	N Collins Blvd	Fall Creek Dr	North	100	Install a signed, marked and lit crosswalk. Add yield line and "Yield Here to Pedestrians" signing in each direction approaching crosswalk to mitigate risk of dual threat situation for pedestrians. Consider additional improvements if a study of pedestrian volumes warrants them, given the long distance to stop-controlled crossing locations in either direction.	12	N/A
2A-GP-CW-13	City of Richardson	New Crosswalk	N Collins Blvd	Fall Creek Dr	South	95	Install a signed, marked and lit crosswalk. Add yield line and "Yield Here to Pedestrians" signing in each direction approaching crosswalk to mitigate risk of dual threat situation for pedestrians. Consider additional improvements if a study of pedestrian volumes warrants them, given the long distance to stop-controlled crossing locations in either direction.	7	N/A
2A-GP-CW-26	City of Richardson	New Crosswalk	Palisades Blvd	South Gate Dr	West	65	Provide marked, signed, and lit crosswalks across Palisades Blvd. Consider curb extensions or a median refuge island in the wide 34-ft roadway. Care should be taken to provide advance warning signs in the eastbound direction due to the crest vertical curve in the roadway to the west. Or, the potential also exists for revising traffic signage to make the north-south route primary. In addition, the Palisades master plan does include the possibility of Palisades Boulevard abandonment east of Empire Dr.	25	$39,900
2A-GP-CW-27	City of Richardson	New Crosswalk	Palisades Blvd	South Gate Dr	East	80	Provide marked, signed, and lit crosswalks across Palisades Blvd. Consider curb extensions or a median refuge island in the wide 34-ft roadway. Care should be taken to provide advance warning signs in the eastbound direction due to the crest vertical curve in the roadway to the west. Or, the potential also exists for revising traffic signage to make the north-south route primary. In addition, the Palisades master plan does include the possibility of Palisades Boulevard abandonment east of Empire Dr.	30	$37,100

2B-AC-SW-01	City of Richardson	New Sidewalk	Melrose Dr	Richardson Dr & Central Expy	North	55		16	N/A
2B-AC-SW-02	City of Richardson	New Sidewalk	N Collins Blvd	North Study Boundary & Central Expy	South	210	Some fill dirt may be needed to level path for sidewalk on slope adjacent to ramp. One tree may need to be removed, and a few others may incur root damage depending on sidewalk's alignment. The City of Richardson reports plans to implement a road diet on the Collins Blvd bridge that will allow for wider sidewalks and protected bike lanes in the vicinity of this improvement. The City also reports this segment will be included in an upcoming Dallas County MCIP application.	21	N/A
2B-AC-VW-V02	City of Richardson	Shared Use Path	N Collins Blvd	Southbound Ramps & Central Expy	South	120	Sidewalk construction in narrow gore area between Collins Blvd main lanes and ramp would require constructing a short retaining wall to level the sloped surface. A pedestrian railing would likely be needed between the sidewalk and the main lanes due to the drop-off. The existing vehicular guard rail end treatment protecting the wall at the beginning of the bridge abutment would need to be removed, and a new end treatment designed and constructed to protect the sidewalk retaining wall. City of Richardson staff reported that schoolchildren from the Winfree Academy northwest of U.S. 75 have been known to cross to and from the Arapaho Center station via the freight rail bridge just to the south of Collins Blvd. To discourage this type of behavior, fencing should be provided around the perimeter of the railroad property, and the Collins Blvd bridge pedestrian experience should be made safer and more comfortable. The City of Richardson reports plans to implement a road diet on the Collins Blvd bridge that will allow for wider sidewalks and protected bike lanes in the vicinity of this improvement. The City also reports this segment will be included in an upcoming Dallas County MCIP application.	27	$39,500
2B-AC-SW-03	City of Richardson	New Sidewalk	Ramp from Southbound Collins Blvd to Southbound Central Expy	Collins Blvd & Central Expy	South	610	Some fill dirt may be needed to level path for sidewalk on slope adjacent to ramp. One tree may need to be removed, and a few others may incur root damage depending on sidewalk's alignment. The City of Richardson reports this segment will be included in an upcoming Dallas County MCIP application.	25	$28,000
2B-AC-VW-V03	City of Richardson	Shared Use Path	Regional Veloweb	N Greenville Ave & Alma Rd	South	160	On the south side of the crosswalk, a portion of the guardrail protecting errant vehicles from the downhill slope below would need to be removed. Regrading of the slope, a retaining wall, and/or a pedestrian railing would be needed to add sidewalk that angles down the slope in either direction from the crosswalk to connect to existing sidewalk along the bottom of the slope. The City of Richardson reports this segment will be included in an upcoming Dallas County MCIP application.	10	N/A

2B-AC-RP-06	City of Richardson	Repair	Southbound Ramps & Central Expy	South	North	25	Sidewalk over the Collins Blvd overpass is only 4 feet wide with no buffer. A storm drain inlet at this location reduces the width further, and the sidewalk adjacent to it has settled, creating a trip hazard. Consider if drainage can be redesigned to accommodate continuous sidewalk of acceptable width. The City of Richardson reports plans to implement a road diet on the Collins Blvd bridge that will allow for wider sidewalks and protected bike lanes. The number of lanes on the Collins Blvd overpass will be reduced from two to one in each direction. The City of Richardson's recent traffic counts from 2018 indicate a peak-hour, peak-direction traffic volume of only about 1,000 vehicles/hour, which can be reasonably accomodated with a single lane per direction. The City of Richardson reports this segment will be included in an upcoming Dallas County MCIP application.	24	$5,600
2B-AC-RP-07	City of Richardson	Repair	Gateway Blvd	North Study Boundary & Central Expy	North	60	Remove and replace a few sidewalk panels that have settled and cracked near a water manhole, creating significant trip hazards.	16	N/A
2B-AC-GR-09	City of Richardson	Gap to Remain	N Collins Blvd	Central Expy & N Greenville Ave	North	115	Because the DART tracks run immediately east of the U.S. 75 Northbound Frontage Road, with Greenville Ave on the east side of the tracks, no meaningful land use for pedestrian access would be provided by building sidewalk adjacent to the tracks. Furthermore, landscaping would need to be removed and the travel experience would be highly uncomfortable for pedestrians.	0	N/A
2B-AC-GR-10	City of Richardson	Gap to Remain	N Collins Blvd	Central Expy & N Greenville Ave	South	115	Because the DART tracks run immediately east of the U.S. 75 Northbound Frontage Road, with Greenville Ave on the east side of the tracks, no meaningful land use for pedestrian access would be provided by building sidewalk adjacent to the tracks. Furthermore, landscaping would need to be removed and the travel experience would be highly uncomfortable for pedestrians.	0	N/A
2B-AC-GR-11	City of Richardson	Gap to Remain	N Greenville Ave	North Study Boundary & N Collins Blvd	West	905	Because the DART tracks run immediately east of the U.S. 75 Northbound Frontage Road, with Greenville Ave on the east side of the tracks, no meaningful land use for pedestrian access would be provided by building sidewalk adjacent to the tracks. Furthermore, landscaping would need to be removed and the travel experience would be highly uncomfortable for pedestrians. Just south of the westbound ramps for Collins Blvd, a large pole for high-voltage overhead electric lines occupies most of the greenway between the curb and the DART fence, allowing insufficient space for sidewalk.	0	N/A
2B-AC-RP-12	City of Richardson	Repair	N Greenville Ave	North Study Boundary & E Collins Blvd	East	255	Existing asphalt pathway has severe cracking and rutting, and should be replaced with concrete sidewalk.	1	N/A
2B-AC-RP-13	City of Richardson	Repair	N Greenville Ave	N Collins Blvd	East	75	Consider changes to drainage of bridge abutment headwall so that moisture and slime does not accumulate on shared-use path under bridge.	16	N/A

ID	Owner	Improvement Type	Street Name	Between	Side of Street	Length (ft)	Notes	Priority Score	Opinion of Probable Cost
2B-AC-SW-38	City of Richardson	New Sidewalk	Alma Rd	Alma Rd & E Arapaho Rd	West	900	Regrading of adjacent ditch may be necessary to provide level way for sidewalk. Modification of drainage structures may be required. The City of Richardson notes that the southern portion of the roadway, which today nearly connects with Arapaho Rd, may be removed as part of future development on private property and may therefore also preclude a sidewalk connection to Arapaho Rd.	13	N/A
2B-AC-SW-39	City of Richardson	New Sidewalk	Alma Rd	Alma Rd & E Arapaho Rd	East	870	Short retaining walls would be needed adjacent to some sloped areas, with associated street light pole relocation, tree root damage, underground utility adjustments, and removal of business landscaping. The City of Richardson notes that the southern portion of the roadway, which today nearly connects with Arapaho Rd, may be removed as part of future development on private property and may therefore also preclude a sidewalk connection to Arapaho Rd.	20	N/A
2B-AC-RP-40	City of Richardson	Repair	W Arapaho Rd	West Study Boundary & Richardson Dr	North	5	Adjust traffic signal hand box to be same elevation as sidewalk so it does not cause a trip hazard.	17	N/A
2B-AC-RP-41	City of Richardson	Repair	E Arapaho Rd	N Dorothy Dr & Grove Rd	South	95	Remove and replace several sidewalk panels near a steel electric utility pole and utility manhole, where severe settlement has created significant trip hazards.	25	$11,100
2B-AC-GR-42	City of Richardson	Gap to Remain	E Arapaho Rd	N Dorothy Dr & Grove Rd	North	225	Utility poles, a traffic signal pole, and a steep driveway block the way for sidewalk in the narrow space between the curb and the fence for a historic cemetery. Regrading and resetting of the fence would be needed to add sidewalk, with likely disturbance to some graves in the cemetery. A sidewalk already exists to bypass the cemetery on its north and west boundaries away from the roadway.	0	N/A
2B-AC-SW-44	City of Richardson	New Sidewalk	N Interurban St	E Arapaho Rd & South Study Boundary	East	695	Steep driveways, the accessibility ramp to a business, concrete steps to entries of several other businesses, sloped concrete retaining walls to business landscaping, and right angle parking flush with the street would all combine to make construction of sidewalk on this side of the street extremely challenging. On-street parallel parking is prevalent on both sides of the street, so a road diet to build sidewalk would also be an unlikely option.	18	N/A
2B-AC-SW-45	City of Richardson	New Sidewalk	Hilltop Ave	N Greenville Ave & N Dorothy Dr	North	830	Three large trees could suffer root damage by constructing sidewalk here. A brick wall adjacent to the greenway runs the entire length of the block with no pedestrian access to the businesses to the north of this otherwise residential street, so demand for pedestrian travel on this side of the street is unlikely. The businesses to the north have access via a driveway on Dorothy Dr, and existing residential sidewalk on the south side of the street provides connectivity.	15	N/A

2B-AC-SW-37	DART/Private Property	New Sidewalk	N/A	Central Expy & Station Platform	N/A	550	Build sidewalk connecting train platform to U.S. 75 frontage road. See station improvement 2B-AC-ST-13. A bent chain link fence and nearby makeshift stepstool near the tracks indicate existing pedestrian demand for this connection. Improvement will require adjusting chain link fence, handrail, and other utilities near the station platform. A right-of-way easement or acquisition would be needed to connect through private property, and adjacent business parking would need to be monitored to ensure it remains available for businesses and not used by DART park-and-ride customers. Some tree roots and business landscaping would be affected. A very short retaining wall may be needed between adjacent parking lots at slightly different elevations. City of Richardson reports this improvement is currently under discussion with DART and the property owners.	53	N/A
Opinion of Probable Cost - DART/Private Property Subtotal									***$0***
2B-AC-SP-V01	Kansas City Southern Railroad	Shared Use Path	Regional Veloweb	North Study Boundary & N Collins Blvd	N/A	910	Some backfill may be needed to level path for sidewalk on slope adjacent to railroad tracks. City of Richardson reports no near-term plans for trail along KCS Railroad line.	17	N/A
Opinion of Probable Cost - Kansas City Southern Railroad Subtotal									***$0***
2B-AC-GR-08	TxDOT	Gap to Remain	Central Expy	North Study Boundary & N Collins Blvd	East	1025	Because the DART tracks run immediately east of the U.S. 75 Northbound Frontage Road, with Greenville Ave on the east side of the tracks, no meaningful land use for pedestrian access would be provided by building sidewalk adjacent to the tracks. Furthermore, landscaping would need to be removed and the travel experience would be highly uncomfortable for pedestrians.	0	N/A
2B-AC-RP-23	TxDOT	Repair	Central Expy	N Collins Blvd & Melrose Dr	West	285	The sidewalk has settled significantly relative to the curb, creating an unacceptable cross slope. Several panels should be removed and replaced.	22	$34,000
2B-AC-RP-24	TxDOT	Repair	Central Expy	Melrose Dr & Monte Blaine Ln	West	5	Remove and replace sidewalk panels that have settled, creating significant trip hazards.	37	$1,800
2B-AC-GR-25	TxDOT	Gap to Remain	Central Expy	E Collins Blvd & E Arapaho Rd	East	1650	Handrail near fire hydrant would need to be adjusted to continue sidewalk north near the Ten 50 BBQ restaurant. Some landscaping adjacent to the restaurant would need to be removed. Farther north, the greenway tapers into a narrow space between the frontage road and the DART tracks. No meaningful land use for pedestrian access would be provided by building sidewalk adjacent to the tracks. Furthermore, landscaping would need to be removed and the travel experience would be highly uncomfortable for pedestrians.	0	N/A
2B-AC-RP-35	TxDOT	Repair	Central Expy	Monte Blaine Ln & W Arapaho Rd	West	45	Remove and replace settled sidewalk panels near drainage problem area at corner of church parking lot since they create a significant trip hazard.	34	$3,200

ID	Owner	Improvement Type	Street Name	Between	Side of Street	Length (ft)	Notes	Priority Score	Opinion of Probable Cost
2C-SV-SW-22	City of Richardson	New Sidewalk	Texas St	North Study Boundary & E Phillips St	East	425	Street does not have existing curb and gutter, which should be constructed with sidewalk to avoid drainage problems. A ditch would need to be filled, with several existing pipe culverts modified or replaced. Some vegetation would need to be removed, and tree root impacts could occur. Except for one 4-plex building on the corner, which already has sidewalk access via Phillips St, the land along this segment is undeveloped. City of Richardson reports this sidewalk will probably be built when the property is redeveloped.	4	N/A
2C-SV-RP-23	City of Richardson	Repair	E Phillips St	Texas St & S Greenville Ave	North	30	Remove and replace sidewalk panels where trip hazards exist due to panel settlement near driveways.	10	N/A
2C-SV-SW-24	City of Richardson	New Sidewalk	McKamy Springs Ct	Central Trail & Brick Row	South	45	Consider providing short break in fence to provide a sidewalk connection to the Central Trail. This would require removal of a short section of fence and part of a short retaining wall, as well as a few medium-sized trees, but would provide a shorter walking distance to the station for many apartment and townhome residents. The City of Richardson indicates they will need to work with the property owner on whether they have a desire for this improvement.	21	N/A
2C-SV-GR-25	City of Richardson	Gap to Remain	Central Trail	Spring Valley Rd	N/A	135	Signalized crosswalks are available at less than 200 feet in either direction along Spring Valley Rd from the station platform and the adjacent Central Trail running along the DART tracks. A crosswalk improvement for more direct pedestrian travel along the trail would pose an undue constraint on vehicular signal coordination given the short distance of the trail detour to cross. Nonetheless, pedestrian crossing demand was observed in the field. Consider adjusting the location of bus stops and adding aesthetic but anti-climb fencing in the median of Spring Valley Road to channelize all pedestrian and bicyclist crossings to the nearby crosswalks. See station improvement 2C-SV-ST-09.	0	N/A
2C-SV-SW-26	City of Richardson	New Sidewalk	S Greenville Ave	Centennial Blvd & Buckingham Dr	West	350	Five large trees would need to be removed to provide sidewalk in narrow space between curb and business parking lot. Above-ground and underground utility boxes and manholes would need to be modified, and excavation would be needed to level the existing mound of earth. A DART bus stop without sidewalk access is posted along this segment.	31	$39,300
2C-SV-SW-28	City of Richardson	New Sidewalk	Buckingham Rd	DART Tracks & S Greenville Ave	South	1355	Sidewalk construction would likely cause root damage to some large trees lining the edge of the Restland Cemetery. Other trees may need to be removed, and short retaining walls could be needed in some places due to the cemetery's elevation above street level. Vegetation and tree branches hanging over the future sidewalk's path would also need to be cleared, particularly for a large stand of bamboo trees near the west end of the gap. A DART bus stop without sidewalk access is posted along this segment.	17	N/A

Opinion of Probable Cost - Private Property Subtotal……									***$0***
2C-SV-SW-02	TxDOT	New Sidewalk	S Central Expy	North Study Boundary & Dumont Dr	West	440	Driveways between these sidewalk gaps may be steep enough to require reconstruction in order to build sidewalk that avoids utility poles, private property, or other adjacent constraints. Short retaining walls would likely be needed to level the way for sidewalk in the narrow, sloped space between the roadway curb and parking lots at a higher elevation. Some business landscaping would need to be removed. Underground utility boxes and manholes would likely need to be adjusted. This gap is on the outside edge of the study area and a long travel distance from the station.	16	N/A

2C-SV-SW-03	TxDOT	New Sidewalk	S Central Expy	Dumont Dr & James Dr	West	120	Driveways between these sidewalk gaps may be steep enough to require reconstruction in order to build sidewalk that avoids utility poles, private property, or other adjacent constraints.	22	$73,100
2C-SV-SW-04	TxDOT	New Sidewalk	S Central Expy	James Dr & S Floyd Rd	West	55	A utility pole blocks the path of existing sidewalk at the southern end of this gap. Two other utility poles and a streetlight pole may also need to be adjusted to build sidewalk. Two wide, steep driveways, one of them to right-angle business parking, would need to be reconstructed or bypassed. Short retaining walls would likely be needed to level the way for sidewalk in the narrow, sloped space between the roadway curb and parking lots at a higher elevation. City of Richardson reports this sidewalk will be built when the property is redeveloped.	20	N/A
2C-SV-SW-06	TxDOT	New Sidewalk	S Central Expy	North Study Boundary & W Phillips St	East	255	Sidewalk construction may require reconstruction of somewhat steep business driveways and adjustments to underground utility boxes. City of Richardson reports that Town North Mazda is expected to be filing new development plans for their site within the year that will address this issue.	8	N/A
2C-SV-RP-08	TxDOT	Repair	S Central Expy	W Phillips St & W Spring Valley Rd	East	25	Correct trip hazard that has occurred due to uneven sidewalk panel settlement.	15	N/A
2C-SV-SW-09	TxDOT	New Sidewalk	S Central Expy	W Phillips St & W Spring Valley Rd	East	105	Backfill would need to be added to provide a level surface for sidewalk adjacent to the Como Motel, requiring a re-design of the drainage system for the site. A grate inlet and underground utility box would need to be adjusted.	21	N/A
2C-SV-RP-10	TxDOT	Repair	S Central Expy	W Phillips St & W Spring Valley Rd	East	65	Remove and replace a few sidewalk panels near a crape myrtle tree and a low point where poor drainage may have caused sidewalk spalling. Repair several other trip hazards caused by sidewalk settlement or tree root heaving.	24	$4,500
2C-SV-SW-11	TxDOT	New Sidewalk	S Central Expy	W Phillips St & W Spring Valley Rd	East	990	A large tree would need to be removed near the corner with Spring Valley Road to build sidewalk unless parking spaces in the adjacent office building surface lot were removed to provide a sidewalk bypass. Bypassing this tree would likely still cause root damage, which is also likely for two other trees nearby. Short retaining walls would likely be needed to build sidewalk in narrow spaces between the curb and elevated parking lots. One or more steep driveways would probably need to be reconstructed. Fire hydrants and streetlight poles may need to be adjusted. City of Richardson reports that redevelopment of the Comerica Bank site is slated to occur in next few years, fixing the issues on that parcel.	25	$225,500

Crosswalk Segments

ID	Owner	Improvement Type	Street Name	At/Between	Side of Street	Length (ft)	Notes	Priority Score	Opinion of Probable Cost
2C-SV-CW-16	City of Richardson	New Crosswalk	S Sherman St	Lingco Dr	North	60	Install new signed, marked, and lit crosswalk with pedestrian ramps.	27	$40,000
2C-SV-CW-17	City of Richardson	Upgrade Crosswalk	Lingco Dr	DART Station Park & Ride	N/A	55	Add yield line and "Yield Here to Pedestrians" signing for two lanes in southbound direction approaching existing signed and marked crosswalk to mitigate risk of dual threat situation for pedestrians. Consider instead implementing a road diet to add a median refuge island. Pedestrian-actuated rectangular rapid flashing beacons (RRFB's) should also be considered for increased pedestrian visibility in either case.	29	$56,000
2C-SV-CW-27	City of Richardson	Upgrade Crosswalk	Buckingham Rd	Central Trail	East	75	Install white crosswalk lines parallel to existing patterned concrete crosswalk that already has lighting, pedestrian ramps and a median refuge. White edge lines as traffic control devices are required to make crosswalks legally enforceable. Add pedestrian warning signs at the crosswalk and advance pedestrian warning signs for the eastbound direction (currently installed only for westbound). Add yield lines and "Yield Here to Pedestrians" signing for both directions to mitigate risk of dual threat situation for pedestrians. Consider a traffic signal to facilitate crossings, particularly in conjunction with the future extension of the Central Trail south of Buckingham Rd at this location. A full traffic signal should be considered instead of a RRFB or pedestrian hybrid beacon due to adjacency to railroad crossing gates and potential confusion with alternative meanings of flashing red lights.	15	N/A
2C-SV-CW-30	City of Richardson	Upgrade Crosswalk	S Greenville Ave	E Phillips St	North	95	Add yield line and "Yield Here to Pedestrians" signing for the two lanes in each direction approaching existing signed and marked crosswalk to mitigate risk of dual threat situation for pedestrians. Consider adding a pedestrian hybrid beacon if warranted by a study of pedestrian volumes during arrival and dismissal times for the First Baptist Church of Hamilton Park and the Richardson ISD Math Science Technology magnet school, both located nearby to the east.	7	N/A

Median Island Detailed Estimate - LOCATION 1C-CB-CW-31

Assumptions

along Executive Drive, heading west from Crawford
assume 45 foot long
tear drop shape - will estimate as 2 triangles
asume max width at Crawford as 10 foot wide

	ITEM NO	ITEM UNIT	QTY	UNIT COST	TOTAL
remove existing conc pavement (will equal median area plus couple of feet for curb and gutter)	0104 6001	SF	560	$0.49	$274.40
add mediian refuge conc pvmt	356	SF	450	$6.00	$2,700.00
add conc curb across median refuge	407	LF	20	$32.00	$640.00
conc C & G along Executive	407	LF	110	$32.00	$3,520.00
add striping west of tear drop directing traffic around median refuge	0666 6035	LF	200	$0.84	$168.00
add signs for median - assume 2 and then one on median	0636 & 0646	EACH	2	$650.00	$1,300.00
					$8,602.40

area of median - assume 2 triangles
0.5 x 45 x 10 x 2 = 450 sf

area of removal
add 45 lf x 2 sides plus 20 feet for median nose to median area
= 450 + [(45 x 2) + 20] = 560 SF

Median Island Detailed Estimate - LOCATION 2A-GP-CW-26

Assumptions

along Palisades Blvd at S Gate Dr
assume 60 foot long
tear drop shape - will estimate as 2 triangles
asume max width at S Gate Dr as 10 foot wide

	ITEM NO	ITEM UNIT	QTY	UNIT COST	TOTAL
remove existing conc pavement (will equal median area plus couple of feet for curb and gutter	0104 6001	SF	740	$0.49	$362.60
add mediian refuge conc pvmt	356	SF	600	$6.00	$3,600.00
add conc curb across median refuge	407	LF	20	$32.00	$640.00
conc C & G along Palisades Blvd	407	LF	220	$32.00	$7,040.00
add striping west of tear drop directing traffic around median refuge					
and also reducing EB traffic to one lane each way. Also along median both sides/edges	0666 6035	LF	800	$0.84	$672.00
add signs for median - assume 2 for PED Crossing,					
plus 1 on each end of median directing traffic around would be 6 total	0636 & 0646	EACH	6	$650.00	$3,900.00
					$16,214.60

area of median - assume 2 triangles
0.5 x 60 x 10 x 2 = 600 sf
area of removal
add 60 lf x 2 sides plus 20 feet for median nose to median area
= 600 + [(60 x 2) + 20] = 740 SF

Median Island Detailed Estimate - LOCATION 2A-GP-CW-27

Median Island Detailed Estimate - LOCATION 2B-AC-CW-55

ASSUMPTIONS

Assume 3 median islands that will be 8 ft wide and total 700 ft long so the leading end is visible from both ends of S-curve
add median nose signs each end as well as road narrows signs NB and SB - 8 total
add striping around new island and on both approaches to median

	ITEM NO	ITEM UNIT	QTY	UNIT COST	TOTAL
rem ex conc rdwy pvmt plus couple (4) ft for new C & G	0104 6001	SF	8450	$0.49	$4,140.50
add refuge conc rdwy pvmt	454	SF	100	$6.33	$633.00
conc refuge med pvmt	356	SF	5500	$6.00	$33,000.00
add C & G across refuge	407	LF	20	$32.00	$640.00
add C & G along median edges	407	LF	1430	$32.00	$45,760.00
add striping along new median	0666 6035	LF	1450	$0.84	$1,218.00
					$85,391.50

remove conc rdwy pvmt
- 8 ft wide + 4 ft C & G = 12 ft wide
- 700 ft long + 4 ft C & G = 704 LF
- total rem 704 x 12 = 8448 SF

conc rdwy refuge pvmt
- 10 x 10 = 100 SF

conc refuge med pvmt
- take total width req'd minus refuge rdwy pvmt
- (700 x 8) - 100 = 5500 SF

C & G across refuge med
- 10 x 2 = 20 LF

C & G along median
- take total length plus end minus refuge width times each side
- (700 + 8*3 -10) x 2
- 714 x 2 = 1428 LF

striping around median go thru refuge leaveout
- 700 + 700 + 8*6 = 1448 LF

Opinion of Probable Construction Cost

CONSTRUCTION COST (WITHOUT SIGNALS)	TOTAL	$12,328.40	$9,052.00
CONSTRUCTION COST	TOTAL	$48,328.40	$45,052.00
ENGINEERING DESIGN	10%	$4,832.84	$4,505.20
GENERAL LANDSCAPING	4%	$493.14	$362.08
SWPPP	2%	$246.57	$181.04
TRAFFIC CONTROL	3%	$369.85	$271.56
MOBILIZATION	4%	$537.52	$394.67
FEDERAL CONTINGENCY	2%	$1,096.17	$1,015.33
OPCC	TOTAL	$56,000.00	$51,800.00
AVERAGE COST PER LF OF SIDEWALK			
GRAND TOTAL FOR GROUP 2C	$528,600.00		

Median Island Detailed Estimate - LOCATION 2C-SV-CW-17

Assumptions

is across Lingco Dr at DART Park & Ride Crosswalk
assume 45 foot long
tear drop shape on both sides - estimate as 2 triangles
assume max width is 10 foot

	ITEM NO	ITEM UNIT	QTY	UNIT COST	TOTAL
remove ex conc pavement (will equal new median area plus couple feet for C & G construction)	0104 6001	SF	560	$0.49	$274.40
add median refuge island median pavment	356	SF	450	$6.00	$2,700.00
add conc roadway pavement thru refuge island space	454	SF	100	$6.33	$633.00
add conc curb across median refuge island	407	LF	20	$32.00	$640.00
add C & C along Lingco Dr across median refuge length	407	LF	110	$32.00	$3,520.00
add striping on SB Lingco Dr directing traffic to one lane each direction	0666 6035	LF	200	$0.84	$168.00
add striping north of tear drop to direct traffic around island approach	0666 6035	LF	200	$0.84	$168.00
add signs - north 1 on median, 2 advance signs to merge	0636 & 0646	EACH	3	$650.00	$1,950.00
					$10,053.40

area of median - assume 2 triangles
0.5 x 45 x 10 x 2 = 450 sf
area of removal
add 45 lf x 2 sides plus 20 feet for median nose to median area
= 450 + [(45 x 2) + 20] = 560 SF
conc rdway pvmt at median refuge assume 10 ft wide x 10 ft long = 100 SF
