5. Conclusions and Recommendations ..... 33

## 1. Introduction

In 2010, the North Central Texas Council of Governments (NCTCOG) launched the Regional Traffic Signal Retiming Program (RTSRP), the goal of which is to maximize the capacity of the existing roadway system by improving traffic operations through signal retiming along selected corridors, in addition to reducing mobile source emissions, improving mobility, and enhancing safety.

Through the RTSRP program, North Texas residents benefit from improved air quality, reduced delay, higher reliability, reduced fuel consumption and vehicle emissions, reduced congestion, and improved efficiency throughout the region.

Phase V of RTSRP started in April 2019 and included corridors in Dallas, Garland, and Richardson. A team of consultants led by Kimley-Horn and Associates, Inc. was selected to complete 290 RTSRP Phase V signalized intersections. Figure 1 through Figure 4 illustrate the locations of these traffic signals. This project has achieved interlocking, seamless progression along more than 70 miles of arterial streets withoutregard to jurisdictional boundaries.

Of the 290 project intersections, 73 were identified as "on-system", i.e., they were on the designated state highway system, and 217 intersections were "off-system", i.e., they were not on the state highway system.

### 1.1 Project Scope

Project intersections were grouped into designated corridors that ranged in size from 8 to 103 intersections. For each corridor, the scope included the following tasks:

- A baseline assessment to document conditions as of the beginning of the project.
- Development, implementation, and fine-tuning of new signal timing plans.
- An after assessment to quantify and document project results.

The project area included twenty major corridors in Dallas, Garland, and Richardson:

- Dallas (106 intersections)
- Webb Chapel Corridor
- Midway Road Corridor
- Frankford Road Corridor
- Greenville AvenueCorridor
- IH 635 (LBJ) Corridor
- Forest Lane Corridor
- Abrams Road Corridor
- Walnut Hill Road Corridor
- Garland (103 intersections) (considered as a single network)
- NW Garland Group
- SW Garland Group
- Richardson (80 intersections)
- Arapaho Road Corridor
- Campbell Road Corridor
- Renner Road Corridor

The project intersections listed in Table 1 are part of the regional super-network, a crossjurisdictional control group spanning hundreds of intersections and nearly a dozen municipalities in North Texas. In this situation, peak period cycle lengths are likely to be determined based on the regional super-network to maintain regional coordination, rather than characteristics of intersections on the corridor.

Table 1. RTSRP Phase V Project Intersections

| COG\# | Intersection | City | Corridor | TxDOT |

Council of Governments

### 1.2 Data Collection

The project included extensive data collection:

- For intersections, peak-hour turning movement counts were made, recording number of vehicles by approach direction and by movement (i.e., left turn, straight through, or right turn). Video data collection methods were used, with post-processing of count data.
- Approximately 36 bi-directional machine counts were made with pneumatic tube-type counters that digitally record the number of vehicles in 15 -minute increments, totaled on an hourly basis. Four supplemental counts were collected in April 2021 in Garland and Richardson to measure the impacts of COVID-19 shutdowns on traffic volumes.

### 1.3 Signal Timing Plans

For all corridors, new timing plans were developed for four time periods - the weekday AM, Midday and PM peaks plus the Saturday peak. In Richardson, the Midday plan was also implemented for weekends and an afternoon "pre-PM" plan was developed and deployed. In many cases, separate versions of the AM and midday plans were required for times when school speed zones are in operation. After new timing plans were operational, extensive "fine-tuning" was performed to improve actual on-street performance.

## 2. General COVID-19 Impacts

The COVID-19 pandemic and shutdowns in North Texas greatly affected this project.Initial traffic data was successfully collected in Garland and Richardson prior to the pandemic. Proposed timing plans were developed and planned for implementation circa April 2020. Dallas County issued a "Shelter In Place" order ${ }^{1}$ effective Monday, March 23, 2020. This order restricted "non-essential" business and travel ${ }^{2}$, creating an unprecedented effect on traffic volumes and patterns, as illustrated by the empty Woodall Rogers Freeway during the AM peak on Tuesday, March 24, 2020 in Figure 5.

Figure 5. Woodall Rogers Freeway at 7:26 AM Tuesday, March24, 2020
Source: Dallas Morning News www.dallasnews.com/photos/2020/03/25/photos-together-in-isolation/

[^0]Similar to the national pattern shown in Figure 6, traffic volumes in North Texas were estimated to drop almost $50 \%$ overall. Rather than implement timings designed for traffic patterns thatwere no longer present, implementation was put on hold. Kimley-Horn, NCTCOG, the City of Dallas, the City of Garland, and the City of Richardson monitored traffic volumes throughout the pandemic as traffic patterns adjusted.

Based on volume trends, the midday and Pre-PM timingplans were implemented to run the entire day. These plans were determined to best fit the current conditions as of November 2020.

## 3. Summary of Recommended Improvements

Dallas, Garland, and Richardson are essentially built-outwithin the project area; most typically recommended improvements have either already been installed or have been programmed as part of future projects. These typical improvements include:

- Dual left turn bays for heavy left turns,
- Right turns for heavy right turns,
- Flashing yellow arrows for protected-permitted left turns,
- Modern traffic signal controllers,
- Removing split-phased operations, and
- Advanced operational strategies(e.g., dual service ofleft turn phases, uneven double cycles).

For the most part, existing phasing and lane-use assignments at project intersections were appropriate for observed volumes and patterns.

The following signal control equipment improvements and signing, striping, or geometric modifications were recommended in the final reports for each project corridor or group of corridors. Some of the improvements have been implemented. Future timing plan updates should be scheduled at intervals of three to five years for all project corridors.

### 3.1 Dallas Corridors

The Frankford Road \& PGBT diamond is recommended to run standard 3-phase operations, and the Midway Road \& PGBT diamond should use standard or modified 3-phase operations by plan. The intersection of Midway Road \& Timberglen Road should be updated to include left-turn arrow heads rather than circular balls. The City of Dallas should integrate new timing on Marsh Lane into the new coordinated timing for Frankford Road, between RosemeadeParkway and Trinity Mills Road.

At Coit \& IH 635 Westbound Frontage Road, it is recommended that the laneassignments of the two left-most lanes be changed from left and left/thru to two left-only lanes. The left-most thru lane ends immediately after theintersection with Coit Road, and the merging creates a bottleneck that stacks into the intersection during peak periods.

At the Greenville Avenue and Meadow Road intersection, it was recommended that a flashing yellow arrow be implemented for the southbound left turn movementat this intersection to allow the northbound left turn to lag during certain timing plans.

### 3.2 Garland Corridors

In conjunction with this project, the City of Garland added cross-streetleft-turn phases at two intersections:

- Fifth Street \& Miller Road - added flashing yellow arrow (FYA) protected-permitted leftturns for the northbound and southbound directions; both were previously permitt ed-only
- Plano Road \& Lawler Road - added a FYA protected-permitted left-turn for the westbound direction, and a permitted-protected left turn for the eastbound directions, both of which
were previously permitted-only; the eastbound direction could not have a FYA because it has a shared left/thru lane

The right-most westbound lane on Miller Road at Jupiter Road was changed from a right-only lane to a shared thru/right lane. No other signing, striping, or geometric modifications were recommended in Garland as part of RTSRP V.

It should be noted that the City of Garland is currently in the process of implementing bond -funded "bottleneck" improvements at the ten of the RTSRP V intersections:

- Arapaho Road \& Shiloh Road
- Belt Line Road \& Garland Avenue
- Belt Line Road \& Shiloh Road
- Buckingham Road \& Plano Road
- Buckingham Road \& Shiloh Road
- FirstStreet \& Lavon Drive/Main Street
- FirstStreet \& Avenue B
- FirstStreet \& Avenue D
- FirstStreet \& Miller Road
- Forest Avenue \& Jupiter Road

Typical improvements will include conversion of single-lane left-turnbays to dual lefts, and addition of right-turnbays.

### 3.3 Richardson Corridors

At Jupiter \& SH 190, it is recommended that existing YIELD signs (designatedR1-2 in the Texas Manual on Uniform Traffic Control Devices) be removed from the northbound and southbound right turns. The right turns are channelized with a free receiving lane, so YIELD signs are unnecessary. Removing these signs will create a free-right turn for both directions improving capacity and reducing delay.

Kimley»>Horn

## 4. Project Results

Final implemented timing planswere designed to integrate with the regional super-network. The implemented plans provide progression across a large swath of the Metroplex. For example, Arapaho Road is coordinated from its western terminus at Marsh Road in Carrollton through Addison, Dallas, Richardson, and Garland, where Arapaho Road turns south an d becomes Garland Avenue. The overall distance which has a continuous progression scheme is a little over 16 miles.

### 4.1 Synchro Measures of Effectiveness

Among the many challenges caused by the COVID-19 pandemic, collecting representative before and after travel time data in a traditional mannerwith floating car travel time runswas not viable. Even using probe-based data, which provides many advantages over traditional data collection methods including readily available and continuous historical data, was n ot a useful source of measures of effectiveness (MOEs). As discussed in Section 2, traffic volumes and patterns were substantially impacted by COVID-19. Finalsignal timings were deployed as traffic patterns approached normalcy in each individual peak. Unlike the standard deployment strategy where all plans are implemented simultaneously, there was no clear line of demarcation between before and after, especially as traffic volumes recovered. With these limitations, quantifying benefits of RTSRP V through modeling was the most appropriate approach.

Project results were estimated from Synchro models used in the development of new traffic signal timing plans. For each corridor, the calibrated model of original timing was compared with the calibrated model of final timing. MOEs compared included total signal delay and fuel consumption along with three categories of emissions (CO, NOx, and VOC). The following annual improvement percentages were estimated by the Synchro comparison:

- Total travel time was reduced by 8 percent
- Total signal delay was reduced by 17 percent ( $>1.5$ million vehicle hours annually)
- Total stops were reduced by 9 percent ( $>66$ million annually)
- Fuel consumption was reduced by 2.2 million gallons annually
- Emissions were reduced by 7 percent
- CO reduction of nearly $\mathbf{1 5 2 , 0 0 0}$ kilograms annually
- NOx reduction of nearly $\mathbf{3 0 , 0 0 0}$ kilograms annually
- VOC reduction of more than 35,000 kilograms annually

Kimley»>Horn

Table 2 provides total measures of effectiveness (MOEs) as calculated with Synchro models consisting of this project's signals. The tables listed below provide Synchro MOEs for the respective corridors listed:

- Table 3. Synchro MOEs - Webb Chapel Road Corridor
- Table 4. Synchro MOEs - Midway Road Corridor
- Table 5. Synchro MOEs - Frankford Road Corridor
- Table 6. Synchro MOEs - Greenville Avenue Corridor
- Table 7. Synchro MOEs - IH 635 (LBJ) Corridor
- Table 8. Synchro MOEs - Forest Lane and Abrams Road Corridors
- Table 9. Synchro MOEs - Walnut Hill Road Corridor
- Table 10. Synchro MOEs - Garland Corridors
- Table 11. Synchro MOEs - Arapaho Road Corridor
- Table 12. Synchro MOEs - Campbell Road Corridor
- Table 13. Synchro MOEs - Renner Road Corridor

It should be noted that Synchro calculates delay for all traffic movements at the included intersections. In many cases, benefits on the regional arterial approaches were greater than documented, but increased cycle lengths resulted in somewhat greater sid e-street delay factored into the overall benefits.

Table 2. Summary of Synchro MOEs

- 52 weeks per year
- 260 weekdays per year

52 Saturdays per year

### 4.2 Annual Delay Reductions

Table 14 summarizes the annual benefits calculated from Synchro, specifically Annual Reduction in Delay (veh-hrs) and Peak Hour Annual Delay Savings. The following rationale was used to estimate the annual reduction in delay from the new timing plans, based on Synchro MOEs:

- Calculations are based on total reduction in delay.
- On each weekday there will be:
- Two hours of benefit per AM peak period per weekday
- Three hours of benefit per MD peak period per weekday
- Two hours of benefit per PrePM peak period per weekday (if applicable)
- Two hours of benefit per PM peak period per weekday
- On each Saturday, there will be five hours of benefit from the Saturday timing plan.
- To be conservative, no benefit is assumed from other hours of the day even though most of the corridors operate the new timing plans for at least 12 hours per day.
- For calculations, 5 weekdays and 1 Saturday per week were used, with 52 weeks per year, resulting in 260 weekdays per year and 52 Saturdays per year.
- For the purpose of economic analysis of transportation improvements, the cost of delay was assumed to be $\$ 21.71$ per vehicle-hour (as reflected in NCTCOG's Mobility 2045 Update value of time ${ }^{3}$ ).

Based on modeled travel time results and assumptions listed above, RTSRP Phase Vhas resulted in delay savings of nearly 1.2 million vehicle hours per year (or more than 133 years of vehicle delay annually) on the project corridors. In terms of delay savings, this translates to more than \$25.3 million annually in driver delay savings (at NCTCOG's Mobility 2045 Update value of time).

[^1]Table 14. Summary of Annual Benefits

## 5. Conclusions and Recommendations

New timing plans implemented in Dallas, Garland, and Richardson have successfully achieved the Regional Traffic Signal Retiming Program goals: to maximize capacity of the existing roadway system by improving traffic operations through signal retiming along selected corridors, in addition to reducing mobile source emissions, improving mobility, and enhancing safety. Through the RTSRP program, North Texas residents benefit from improved air quality, reduced delay, higher reliability, reduced fuel consumption and vehicle emissions, reduced congestion, and improved efficiency throughout the region.

To further improve operations, adjacentsignals in the area should be retimed to integrate with the RTSRP V corridors and the regional super-network.

Typically, future timing plan updates are recommended at intervals of three to five years. Due to on-going and evolving traffic patterns, these timing plans should be continuously monitored and updated to reflect current traffic patterns.
