TOTAL Warnings Issued	32
------------------------------	-----------

Warning Issued = Ozone levels have exceeded a 1-hour average threshold which often ends up resulting in an exceedance of the ozone standard over an 8-hour average. NOTE: A warning does not always result in an exceedance day.

Key to Ozone Highlight Colors

Values in the ozone tables are color-coded to match the ozone warning levels described on the Ozone Warning Status web page. Ozone levels have been mapped to colors based on a projected eight-hour average calculated from the measured one-hour levels.

Measured values range from 75 to 89 ppb.

Ozone levels in this range are considered moderate.

- Unusually sensitive people, such as those with asthma, should consider limiting prolonged outdoor activity.

Measured values range from 90 to 114 ppb.

Ozone levels in this range are projected to be unhealthy for sensitive groups based on the eight-hour AQI standard for ozone.

- Active children and adults as well as people with respiratory disease, such as asthma, should limit prolonged outdoor exertion.

Measured values range from 115 to 139 ppb.

Ozone levels in this range are projected to be unhealthy based on the eight-hour AQI standard for ozone.

- Everyone, especially children, should limit prolonged outdoor exertion.
- People with respiratory disease, such as asthma, should avoid prolonged outdoor exertion.

Measured values range from 140 to 404 ppb.

Ozone levels in this range are projected to be very unhealthy based on the eight-hour AQI standard for ozone.

- Everyone, especially children, should limit outdoor exertion.
- People with respiratory disease, such as asthma, should avoid all outdoor exertion and limit exposure by staying inside (air conditioned spaces are best).
