TOTAL Ozone Action Days

6

Ozone Action Day = Air Quality Forecasting suggests a high possibility of exceeding the ozone standard of 70 parts per billion for an eight-hour average.

Key to Ozone Highlight Colors

Values in the ozone tables are color-coded to match the ozone warning levels described on the Ozone Warning Status web page. Ozone levels have been mapped to colors based on a projected eight-hour average calculated from the measured one-hour levels.

Measured values range from 55 to 70 ppb.

Ozone levels in this range are considered moderate.

- Unusually sensitive people, such as those with asthma, should consider limiting prolonged outdoor activity.

Measured values range from 71 to 85 ppb.

Ozone levels in this range are projected to be unhealthy for sensitive groups based on the eight-hour AQI standard for ozone.

- Active children and adults as well as people with respiratory disease, such as asthma, should limit prolonged outdoor exertion.

Measured values range from 86 to 105 ppb.

Ozone levels in this range are projected to be unhealthy based on the eight-hour AQI standard for ozone.

- Everyone, especially children, should limit prolonged outdoor exertion.
- People with respiratory disease, such as asthma, should avoid prolonged outdoor exertion.

Measured values range from 106 to 200 ppb.

Ozone levels in this range are projected to be very unhealthy based on the eight-hour AQI standard for ozone.

- Everyone, especially children, should limit outdoor exertion.
- People with respiratory disease, such as asthma, should avoid all outdoor exertion and limit exposure by staying inside (air conditioned spaces are best).
