## Project Background

The North Central Texas Council of Governments (NCTCOG) serves as the Metropolitan Planning Organization (MPO) for 16 counties in North Central Texas. The objective of NCTCOG is to support their membership, made up of local governments and various public agencies, in the planning and implementation of a variety of regional development projects. Through this analytic effort, NCTCOG sought to conduct a comprehensive review of the 2009 National Household Travel Survey (NHTS) data collected from approximately 5,900 households located within the 12 -county NCTCOG metropolitan planning area (MPA), with the goal of identifying the usefulness of these NHTS data for its regional transportation model.

The NHTS was first conducted for the Federal Highway Administration (FHWA) by the United States Census Bureau in 1969 as an in-person interview called the National Personal Travel Survey. Over the years, the survey has evolved from in-person to telephone survey methods, and has, at times, included a long-distance trip data collection component. The intent of this periodic national travel survey has been to provide information about trends in transportation system usage over time.

In 1990, the add-on program began with three state and/or regional agencies adding samples for their specific areas to the national sample. In 2001, the survey was renamed as the National Household Travel Survey. That year, the NHTS had nine add-on programs and collected a total of approximately 66,000 households. The 2009 NHTS began its 13 -month-long data collection field period in April 2008. The 2009 survey consisted of a national sample of 25,000 households and 20 regional and state add-on areas of varying sizes, which added another 125,000 households-by far the largest effort undertaken in the history of the NHTS program. The Texas Department of Transportation (TxDOT) was the largest of the add-on regions to take part in the 2009 NHTS. The TxDOT sample size was 20,000 households.

To provide a comprehensive review and analysis of the NHTS data, Westat brought together an unparalleled team of experts in travel survey data collection, transportation data analysis and auditing, and transportation modeling that included Parsons Brinckerhoff, Dunbar Transportation Consulting and ETC Institute.

## Task 1: Comprehensive Analysis of the 2009 National Household Travel Survey (NHTS)

## Overview of task

Westat and their subcontractors (Westat) performed a comprehensive analysis of the sampling design, household recruitment methods, household contacting and re-contacting methods, and expansion weights for the 2009 NHTS. Westat led meetings with NCTCOG staff, including a webinar in which an overview of the NHTS processes and research for Task 1 memo was presented. The final Task 1 memo was developed to provide NCTCOG a comprehensive understanding of all aspects of the NHTS process from design to expansion, highlighting the aspects of the survey conducted in the North Central Texas region.

A list of deliverables for this task is provided in Appendix A. In addition to the products created specifically for this contract, Westat provided supporting documentation from the original NHTS.

## Task 2: Defining Acceptable Survey Records and Data Checks

## Overview of task

Westat provided NCTCOG with a comprehensive list of data checks for each NHTS data file (household, person, vehicle, trip and location); this list contained checks that had been performed during the creation of the original 2009 NHTS dataset as well as suggested checks for the dataset. From this list, Westat implemented five types of data checks; re-geocoding, non-response, range, interdependency and consistency. The objective of this activity was to establish the accuracy of the coded data and to determine the usefulness of the data based on the analysis used.

- Re-geocoding: The original NHTS data were batch and interactively geocoded using TeleAtlas database. The re-geocoding for the NCTCOG batch matched trip ends using the NAVTEQ database.
- Non-response edits were conducted and data with missing, refused or don't know responses were flagged.
- Range checks were applied to confirm the values in the data met the criteria for the individual variable.
- Interdependency checks were applied to confirm that variables were derived accurately.
- Consistency checks were implemented to verify that values of variable which appeared in multiple tables agreed across all tables.

The final Task 2 memo (NCTCOG-NHTS-Task 2-Check-Results-Memo-2013-06-19.pdf) provides an overview of the process engaged in the completion of Task 2, including the regeocoding of the NHTS trip ends.

A list of deliverables for this task is provided in Appendix A.

## Task 4: Data Identification

## Overview of task

During the process of conducting this study it became evident that Task 4 (data identification) should precede Task 3 (data imputation) in order of completion and that data identification would inform the imputation process.

The objective of this task was to examine the usability of NHTS data for development of regional travel demand models (TDMs) for the NCTCOG metropolitan area. The data usability for model development is primarily determined by examining three criteria, namely data completeness, data accuracy, and data consistency. The third, and perhaps the most critical criterion for model development, data consistency, was examined in this task.

The data needs to be more consistent for the development of advanced tour-based and activity-based models (ABMs) since modeling is undertaken at a disaggregate level. Time and space continuum must also be maintained in ABMs , unlike in traditional trip-based models. Furthermore, modeling household interactions and joint activity participation requires ensuring consistency across multiple person responses further increasing the data consistency needs. The analysis for this task was undertaken assuming that the NHTS data would be used for the development of an ABM, with the underlying idea being that the stringent data consistency conditions can be relaxed appropriately for relatively simpler tour-based and trip-based models. Certain attributes apply to all types of models, for example trip departure time, destination, purpose or activity type, and mode, among others. Missing household and person attributes is not a critical hindrance to the development of ABMs since missing explanatory variables can be handled easily within discrete as well as continuous choice models without discarding the records; therefore, the main focus of this task was identifying records with missing and inconsistent travel and activity attributes.

The results of this task are presented in Task 4 Technical Memo FINAL.pdf (see Appendix A for the list of datasets provided with this memo. Specific recommendations resulting from the findings of this task included the definition of criteria to be used to identify records to be included in the reweighting task.

At this stage, records included in the final NCTCOG dataset were limited to those with weekday travel dates and where 100 percent of household members completed the travel portion of the diary; completing the travel portion of the diary included persons who traveled, officially confirmed that they did not travel, were less than 5 years old so no travel was reported, or were reported as out of the country. Travel dates on national holidays and over Thanksgiving and Christmas breaks were also excluded. Table 1 provides the list of days that were excluded from the final dataset. The total number of travel days in the final NCTCOG dataset is 239 . After this analytic stage, 3,273 households remained in the NCTCOG dataset.

Table 1: NHTS travel dates excluded from the NCTCOG final dataset

| Holiday | Start Date | End Date\# Weekdays <br> Excluded |  |
| :--- | ---: | ---: | :---: |
| Memorial Day | $5 / 26 / 2008$ | $5 / 26 / 2008$ | 1 |

| Winter Break | $12 / 22 / 2008$ | $1 / 2 / 2009$ | 10 |
| Total |  | 21 |  |

## Task 3: Data Imputation

## Overview of task

The objective of this task was to impute data for missing demographic data. The expectation was that some of the invalidated or incomplete data fields could be reasonably imputed and used, rather than discarding these households. However, through the completion of Task 4 it was determined that the only demographic variable used by modelers that would require imputation was household income.

Because income is such an important analytic variable NCTCOG wanted to ensure that any imputation would provide valid values. There are many ways to impute data. Considering timing and cost, Westat recommended using a hot deck imputation procedure. At the request of NCTCOG, Westat performed a test of the hot deck methodology proposed to impute income for the 220 households (out of 3,273 ) that did not provide a response to the survey question. This section describes that imputation test.

Hot deck imputation is a procedure in which the value from a respondent is duplicated to replace the missing value of a non-respondent from the same survey. Because the imputed values are actual respondents' values, hot deck imputation has the valuable property that imputed values are always feasible values. The most common form of hot deck is to cross classify auxiliary variables into imputation classes and perform the imputation within classes. This is the imputation form used by WESDECK.

WESDECK is a customized imputation program developed at Westat. It is a variant of the hot deck method of imputation. Hot deck imputation is a technique where cases with missing values for specific variables have the "holes" in their records filled in with values from other cases. For brevity, the value for a specific case of a specific variable is referred to as an "item." Using that term, missing items are replaced with reported items from other cases. The case that contributes the reported item is referred to as the donor. The class of cases that contribute items is referred to collectively as "potential donors." The case with the missing item is referred to as the recipient.

The success of hot deck imputation in part depends on whether or not there exists available auxiliary variables that are sufficiently correlated with the variable that needs to be imputed and whether there exists sufficient number of donors relative to the number of recipients in each imputation cell.

The imputation test included the following steps:

1. The NCTCOG randomly selected 50 records from the dataset with valid household income values and blanked out household income for 50 records. NCTCOG only provided details for each household record which were necessary for the hot deck imputation.
2. Westat ran WESDECK to impute household income for these records and provided the imputed values to NCTCOG.
3. NCTCOG then reviewed and compared the imputed results against the actual values for each of the 50 records.

In evaluating the results, NCTCOG recoded the original and imputed household income values to reflect household income categories that were going to be used in the raking or expansion process. These are presented in Table 2.

Table 2: Imputation test variables

| Housing <br> Income Raking <br> Categories | NHTS <br> Household <br> Income <br> Categories | description |
| :---: | :---: | :---: |
|  | 1 | $<\$ 5,000$ |
|  | 2 | $\$ 5,000-\$ 9,999$ |
| 1 | 3 | $\$ 10,000-\$ 14,999$ |
|  | 4 | $\$ 15,000-\$ 19,999$ |
|  | 5 | $\$ 20,000-\$ 24,999$ |
|  | 6 | $\$ 25,000-\$ 29,999$ |
|  | 7 | $\$ 30,000-\$ 34,999$ |
|  | 8 | $\$ 35,000-\$ 39,999$ |
|  | 9 | $\$ 40,000-\$ 44,999$ |
|  | 10 | $\$ 45,000-\$ 49,999$ |
|  | 11 | $\$ 50,000-\$ 54,999$ |
|  | 12 | $\$ 55,000-\$ 59,999$ |
|  | 13 | $\$ 60,000-\$ 64,999$ |
|  | 14 | $\$ 65,000-\$ 69,999$ |
|  | 15 | $\$ 70,000-\$ 74,999$ |
| 4 | 16 | $\$ 75,000-\$ 79,999$ |
|  | 17 | $\$ 80,000-\$ 99,999$ |
| 4 | 18 | $>=\$ 100,000$ |

Imputation was conducted twice. In the first run, the donor pools were formed by doing a crossclassification of these variables.

- Household ownership (owner or renter)
- Household size (1, 2, 3, 4, 5 or more)
- Number of workers ( 1 or less, 2, 3 or more), and
- Number of vehicles (1 or less, 2, 3, 4 or more).

The first run of the imputation test resulted in only 20 out of the 50 imputed test records ( 40 percent) matching the actual household income category.

In an attempt to improve the match rate, we ran a second test using the same predictor variables with household life cycle inserted between household size and number of workers in the household.

- Household ownership (owner or renter)
- Household size (1, 2, 3, 4, 5 or more)
- Life cycle (HHs with no children or retirees, HHs with at least one child under 21, and HHs with no children and at least one retiree),
- Number of workers (1 or less, 2, 3 or more), and
- Number of vehicles ( 1 or less, 2, 3, 4 or more).

The results of this run were actually worse than the first run. Only 17 out of the 50 test records ( 34 percent) matched the actual household income values. Consequently the client decided not to impute for household income. The 220 records that were missing household income were dropped from the final data set, so it contained a total of 3,053 records.

## Task 5: Reweighting of the Survey Data

## Overview of task

The objective of this task was to evaluate the need for reweighting the NHTS data for North Central Texas region. The evaluation included determining which level of geography and Census product should be used to create the new weights to more current control totals.

An advantage of reweighting the data was that the raking could be refined or restricted to the 12 counties comprising the NCTCOG MPA. The original NHTS weighting procedure used population totals for the whole state of Texas, so there is no guarantee that the weighted estimates for the NHTS sample in North Central Texas accurately reflect the population of North Central Texas for the characteristics used in the raking step. By restricting the reweighting to the NCTCOG region, we would be assured that the sample results for the characteristics using in raking accurately reflect the population of the region.

## Background of the NHTS Weighting

Westat statisticians are extremely familiar with 2009 NHTS dataset. Westat developed the sample design and calculated survey weights as prescribed by FHWA for the original dataset. The 2009 NHTS was a list-assisted random-digit-dial (RDD) sample design survey in which the objective was to yield an equal probability sample of households with landline telephones. This national sample was then supplemented with sample in 20 additional areas including the whole state of Texas. Two independent sample frames were used at the sampling stage, the national and the add-on region. Because of the integrated nature of the state/national sample design, the weighting procedure used to compute survey weights was complex. In addition to the typical steps employed in weighting procedures-construction of base weights, adjustments for nonresponse, and expansions of household and person weights to independent demographic population totals (often referred to as iterative proportional fitting (IPF) or "raking")compositing and weight trimming steps were also implemented.

Compositing is a statistical procedure that allows for combining of two samples (the national and state samples in the case of NHTS) to result in a single set of weights that allow data from different samples to be combined and analyzed together. The composite adjustment appropriately rescales the weights for both samples to reflect pooling of the data.

Westat provided FHWA with an initial set of weights that were used by a select team of transportation planners to test key public transit estimates. Westat and FHWA worked together to identify areas in which the original weights could be enhanced to provide more precise estimates of transit use. Raking dimensions were refined, and a sophisticated trimming process was implemented in the final survey weights.

Weight trimming is an adjustment procedure that involves detecting and reducing extremely large weights. "Extremely large weights" generally refer to large sampling weights that were not anticipated in the design of the sample. Unusually large weights are likely to produce large sampling variances for statistics of interest, especially when the large weights are associated with sample cases reflective of rare or atypical characteristics. To reduce the impact of these large weights on variances, weight reduction methods are typically employed.

The weight trimming procedure used for the enhanced NHTS weights was implemented iteratively with the expansion or raking process so that the trimmed portions of the weights were redistributed across all the remaining weights. As a result, the final weights achieve consistency with the known population distributions without any excessively large survey weights.

## Reweighting of the NCTCOG dataset

In the reweighting task, survey weights were developed for four types of analytic units associated with the NHTS NCTCOG sample - household weights, person weights, vehicle weights, and trip weights - to permit inference to the corresponding target populations.

In addition to the survey weights, replicate weights were developed for each type of analytic unit as well. The replicate weights are used to calculate the variances of survey estimates using the jackknife replication method. The methods used to derive these weights were aimed at reflecting the features of the sample design, so that when the jackknife variance estimation procedure is implemented, approximately unbiased estimates of sampling variance are obtained. In addition, the various weighting procedures were repeated on each set of replicate weights to appropriately reflect the impact of the weighting adjustments on the sampling variance of a survey estimate.

The overall steps in the weighting process were as follows:

- Construction of base weights-the base weights are the reciprocals of the telephone frame sampling rates;
- Household-level nonresponse adjustments;
- Household-level raking and trimming;
- Person-level raking and trimming;
- Computation of vehicle weights and trip weights.

These are essentially the same weighting steps carried out for the 2009 NHTS but with important modifications. The first modification involved the calculation of the household base weight. In the 2009 NHTS, the household base weights were calculated for the year-long NHTS dataset which took quarter
and sample type (national sample versus Texas add-on sample) into account. To simplify the process for the reweighting, we pooled all samples together regardless of quarter and sample type. As a result of this simplification, the need to carry out a composite adjustment to combine the various samples was no longer needed.

In the 2009 NHTS weighting procedures, a household was defined as useable if at least $50 \%$ of the eligible adults completed the retrieval interview. For the reweighting of the NCTCOG sample, a "usable" household was redefined as all household members aged five and older completing the retrieval interview. With the new definition of "usable" household, person nonresponse is not possible. As a result, the person-level non-response adjustment task used for the 2009 NHTS weighting was not necessary for the reweighting of the NCTCOG dataset.

The most significant change to the weighting procedure involved the use of a different set of characteristics for the household- and person-level raking adjustments. The choice of the new characteristics was to adequately and specifically reflect characteristics associated with travel behavior in North Central Texas.

The household-level raking characteristics used for the reweighting task included the number of household workers, number of household vehicles, household size, household income, and county of residence. The specific raking cells and control totals ${ }^{1}$ used at the household level are shown in Appendix B.

The person-level raking characteristics used for the reweighting task included age and gender by county of residence. The specific raking cells and control totals ${ }^{2}$ used at the person level are shown in Appendix C.

## Task 6: Table Summaries

## Overview of task

Presentation and interpretation of results through tabulation and graphs of survey data can reveal the trends of households and individual trip makers in the region. Task 6 included data tabulation and reporting from broad and detailed perspectives. Customary tabulations that offer socioeconomic snapshots and trip-making characteristics of the region are provided. Appendix A, Task 6 contains the list of tables provided.

Also included in Task 6 is the preparation of this summary report providing an overview of the entire project and presenting key summary tables and discussion.

## Findings

As detailed in the summaries of Tasks 1 through 5, the goal of this project was to evaluate the usefulness of the NHTS dataset for the NCTCOG MPA Travel Demand Model (TDM). To meet the needs of the

[^0]${ }^{2} 2006$ - 2011 five year ACS data used.

TDM, the original NHTS dataset was subset to include records that fill the requirements of the model, including among other things the removal of weekends and holidays from the dataset. The following section of this report will provide a high-level presentation of key tables ${ }^{3}$. This section will also provide observations about the NCTCOG region data, some comparisons of the NCTCOG dataset to the original NHTS dataset ${ }^{4}$ and considerations for the region moving forward.

A note about the tables and dataset: There may be some discrepancies between the sum of the weighted data found in the database and the values provided in the table summaries. The discrepancies are all less than $0.3 \%$ and some are just $0.01 \%$ off.

These discrepancies are the result of the data processing package (STATPAC) used to create the summary tables. STATPAC creates a new database when the weighting factors are applied. A requirement is that the database cannot have partial records, and therefore all numbers were rounded to the nearest integer. As a result the number of records in the weighted database will almost never perfectly match the sum of the weighting factors, but the results are statistically equivalent.

When making comparisons between the NHTS and the NCTCOG data, it is important to consider the differences in the composition of each dataset. The modifications made to the NHTS dataset to meet the analytic objectives of the NCTCOG MPA TDM are discussed in detail in Tasks 3 through 5. Those included eliminating weekend travel, holidays, removing households where less than 100 percent of all household members reported their travel and discarding those households failing to report income. While the desire to compare the observations of the regional to the national data is strong, this should be done with caution as the differences in the two data sources are not comparable and should not be taken at face value.

A comparison of overall trip rates and trips by household size between the original NHTS to the subset NCTCOG datasets is presented in Table 3 and shows an average of 2.24 more daily trips per household in the NCTCOG dataset than in the NHTS dataset. The exclusion of weekend and holiday travel days alone could explain the difference in overall trips per household ${ }^{5}$. While trips rates in one and two person households are similar across datasets, three plus person households made 2.61 to 6.57 more daily trips on average in the NCTCOG dataset. This too could be a product of the exclusion of weekend travel days. Larger households with children may create more weekday trips related to the children's activities, trips that are not made by traditional one and two person households.

[^1]14 Review and Analysis of the NHTS: Final Report
Westat

Table 3: Trips per household by household size

|  | Household Size |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 1 | 2 | 3 | 4 | 5+ | Total |
| Total Number of Day Trips | 1,780,543 | 4,760,543 | 4,833,597 | 6,896,274 | 4,954,141 | 23,225,099 |
| NCTCOG Households | 570,287 | 693,461 | 393,523 | 382,061 | 226,135 | 2,265,467 |
| Average Number of Day Trips Per Household | 3.12 | 6.86 | 12.28 | 18.05 | 21.91 | 10.25 |
| Total Number of Day Trips | 118,421,000 | 260,553,000 | 175,068,000 | 199,687,000 | 152,592,000 | 906,321,000 |
| NHTS Households | 31,741,000 | 37,728,000 | 18,104,000 | 15,584,000 | 9,945,000 | 113,102,000 |
| Average Number of Day Trips Per Household | 3.73 | 6.91 | 9.67 | 12.81 | 15.34 | 8.01 |

[^2]The percentage of daily trips by trip purpose ${ }^{6}$ for the NCTCOG region is presented in Figure 1. Table 4 shows the number and percentage of daily trips by trip purpose. Home-based other (HBO) and non-homebased (NHB) trips comprise more than half the daily trips in the NCTCOG region ( 58.1 percent). Homebased work trips (HBW) make up 13.6 percent of all trips, less than the home-based shopping (HBSHOP) trips (17.7 percent). Table 5 presents the NCTCOG region data for primary trip purpose by tour showing that work trips represent $25.8 \%$ of trips. When considering trip purpose by tour, the percentage of work tours is nearly twice ( 25.8 percent) as high as the trip based percentage of work trips ( 13.6 percent). This discrepancy would indicate that higher percentages of HBO and NHB trips occur as part of a work tour.

Figure 1: NCTCOG Region trips by trip purpose

Table 4: NCTCOG Region number and percentage of trips by trip purpose

| Trip Purpose | Trips | Percentage of <br> all trips |
| ---: | ---: | ---: |
| HBSHOP | $4,119,162$ | $17.7 \%$ |
| HBSOCREC | $2,422,552$ | $10.4 \%$ |

Figure 2 presents the NCTCOG region trips by purpose and household size and shows that larger households, those with five or more household members, make fewer HBW trips than they do all other types of trips. Similar findings are seen in the NHTS tips by purpose and household size (see Figure 3). This could be due to making stops to run errands, or drop off children at school on the way to the workplace. The percentages of HBSOREC trips vary little across household size in both samples. Overall, the trip purpose patterns are similar across both datasets.

[^4]Figure 4 shows the average number of trips per household by household income for the NHTS and NCTCOG datasets. While the NCTCOG data reflects a higher average number of trips than the NHTS data, similar to the findings with trip purpose by household size (Figure 2 and Figure 3), the pattern is the similar across datasets. The average number of trips per household is correlated with household income, with households reporting higher income levels making more trips. Overall the comparison between the NHTS and the NCTCOG data appear closely related until the reported income is $\$ 75,000$ or more when the difference between the number of trips widens to more than two trips per household.

Figure 4: Comparison of NHTS and NCTCOG average number of trips per household by income

Source for NHTS data: Federal Highway Administration, 2009 National Household Travel Survey (NHTS)
These data presented in Figure 5 reflect that the overall number of trips per household is correlated with the number of household workers with households with more workers making more trips. In the NCTCOG dataset, households with four workers made 6.4 times the number of average daily trips as did households with no workers, and 1.6 times as three worker households. Households with workers in the NCTCOG data made more trips on average than those in the NHTS data, the difference becoming greater as the number of workers in the in household increases. Households with four or more workers made 11.5 more trips in the NCTCOG sample than did the same size households in the NHTS sample.

Figure 5: NCTCOG Region average number of trips per household by number of workers

Source for NHTS data: Federal Highway Administration, 2009 National Household Travel Survey (NHTS)

Figure 5 shows that households with four or more workers make the majority of trips ( 30.6 percent in the NCTCOG dataset); however, these trips are not necessarily HBW trips (Figure 6). Three worker households made more HBW trips than did any other households with workers. The percentage of trips is generally balanced across purpose, except that 30 percent of trips made by zero-worker households are HBSHOP trips and of course, the lack of HBW trips in zero-worker households.

Figure 6: NCTCOG Region average number of trips per household by trip purpose and number of workers

Figure 7 presents the NCTCOG region person trips by mode and Table 7 presents a list of all modes, comparing the percentage of mode share for each in the NCTCOG and NHTS datasets. The NHTS collects mode differently than many region surveys by separating out various types of personal occupancy vehicles (POVs) and collecting driver information at the trip detail reporting level. As such, the survey mode data readily shows the mode share by vehicle type. The NCTCOG data shows a mode share for POVs at 89.9 percent compared with 82.7 percent in the NHTS data. Additionally, sport utility vehicles (SUVs) were more than twice as common ( 22.1 percent) in the NCTCOG data as in the national dataset (10.4 percent). Walk as a mode of transportation was lower in the NCTCOG data ( 6.3 percent) compared with the NHTS data ( 10.4 percent), as was local public bus ( 0.3 versus 1.2 percent), but other modes were reported similarly across datasets.

Figure 7: NCTCOG region person trips by mode

Table 7: Person trips by mode comparison

| Mode | NCTCOG | NHTS | Mode | NCTCOG |
| :--- | ---: | ---: | :--- | :--- | NHTS

Source for NHTS data: Federal Highway Administration, 2009 National Household Travel Survey (NHTS)

While vans make up the smallest mode share in the NCTCOG region (Figure 7 and Table 7), they contribute the largest number of daily trips by vehicle type as shown in Figure 8. Vans have 2.4 percent more trips than cars and 0.9 percent more than SUVs.

Figure 8: NCTCOG Region average number of daily trips per vehicle type

Figure 9 shows the average number of trips by age. The NHTS did not collect trip details for the population under five years old. The average number of daily trips is fairly consistent in the 5 to 24 year old population, varying no more than 0.5 trips at most, and ranges from a low of 2.8 trips per day for the 75 and older residents of the region to a high of 4.7 trips for the 35 to 54 year olds.

Figure 9: NCTCOG Region average number of daily trips by age

Table 8 shows that gender in the NCTCOG data has less of an effect on the average number of daily trips compared with the NHTS data. In the NHTS women made on average 0.6 more trips than men compared to 0.3 in the NCTCOG dataset. The average number of trips is also somewhat higher in the NHTS dataset.

Table 8: Comparison of NCTCOG and NHTS trips by gender

|  |  | Male | Female | Total |
| :--- | :--- | ---: | ---: | ---: |
| NCTCOG | Total Number of Day Trips | $10,989,411$ | $12,235,687$ | $23,225,099$ |
|  | Total Number of Persons | $3,123,423$ | $3,202,523$ | $6,325,946$ |
|  | Average Number of Day Trips Per Person | $\mathbf{3 . 5 2}$ | $\mathbf{3 . 8 2}$ | $\mathbf{3 . 6 7}$ |
| NHTS | Total Number of Day Trips | 540,698 | 626,623 | $1,167,321$ |
|  | Total Number of Persons | 139,257 | 143,797 | $\mathbf{2 8 3 , 0 5 4}$ |
|  | Average Number of Day Trips Per Person | $\mathbf{3 . 8 0}$ | $\mathbf{4 . 3 6}$ | $\mathbf{4 . 1 2}$ |

Source of NHTS data: Federal Highway Administration, 2009 National Household Travel Survey (NHTS)

When trip purpose by gender is examined in Figure 10, there is little difference between the genders except for HBW and HBO purposes. Men make 6.5 more HBW trips than do women, while women make 5.4 more HBO trips than do men.

Figure 10: NCTCOG Region daily person trips by trip purpose and gender

In Table 9 the distribution of trip purpose by education is presented for all known levels of education. In the NCTCOG data the average number of daily trips is correlated with level of education. The more educated the respondent, the more trips are made.

Table 9: NCTCOG Region average number of trip by education level

|  | Less then <br> high school <br> graduate | High school <br> graduate, <br> include GED | Some college <br> or Associate's <br> degree | Bachelor's <br> degree | Graduate or <br> Professional <br> Degree |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: |
| Total Number of Daily Trips | $1,287,196$ | $3,483,890$ | $5,592,049$ | $5,502,300$ | $3,159,121$ |
| Total Number of Persons | 395,803 | 968,607 | $1,333,510$ | $1,161,208$ | 660,805 |
| Average Number of Daily Trips Per Person | 3.25 | 3.60 | 4.19 | 4.74 | 4.78 |

Figure 11 presents the overview of trip purpose by education. The data show an inverse relationship between education and trips whose purpose is HBSHOP. The HBO trips are more common among those with less than a high school degree. The difference between less than high school graduate and graduate or professional degree ( 18.8 percent) is most likely due to trips to school. Table 10 shows that HBO represents nearly half of all trips for the 5 to 19 year old population.

Figure 11: NCTCOG Region trip purpose by education

| Total | $17.7 \%$ | $10.4 \%$ | $13.6 \%$ | $28.0 \%$ | $30.1 \%$ | $0.2 \%$ | $100.0 \%$ |

Figure 12 presents the NCTCOG regional trip distribution for the NCTCOG MPA alone. Only 13.6 percent of all trip purposes were HBW, and HBO and NHB represented more than half of the trips in the region (58.1 percent).

Figure 12: NCTCOG Region household trips by purpose

Figure 13 presents a comparison of trip purpose between the NCTCOG and NHTS datasets. HBSHOP and HBSOCREC trips comprise a smaller percentage of trips for the NCTCOG dataset. The results are different for HBW and HBO trips. Because the NCTCOG data excluded weekend and holiday travel dates, it is reasonable that HBW trips would represent a higher proportion of the total trips as well as the HBO trips, a category that includes transporting children to school and other after school activities.

Figure 13: Comparison of NCTCOG and NHTS trip purpose

Source of the NHTS data: Federal Highway Administration, 2009 National Household Travel Survey (NHTS)

Examination of trip purpose by worker status in Figure 14 shows that 22.3 percent of all trips made by workers are HBW and represent only a slightly higher percent of daily trips than HBO trips. Compared with workers, non-workers make 36.5 to 39.2 percent more HBSHOP, HBSOCREC and HBO trips.

Figure 14: NCTCOG Region trip purpose by worker status

Figure 15 shows that the percentage of HBW trips is consistent in households with zero to four vehicles ranging only 2 percent ( 12.3 to 14.4 percent). The percentage of trips is highest in five vehicle households ( 20.3 percent) and lowest in six or more vehicle households ( 8.5 percent).

Figure 15: NCTCOG Region percentage of HBW trips by number of household vehicles

Income level impacts the number and types of trips that people make. Trip purpose by household income in the NCTCOG region is presented in Figure 16. Lower income households make fewer HBSOCREC and HBW trips than those households with higher incomes. All households make more HBO and NHB trips than any other type of trip and about five percent more HBSHOP trips are made by households reporting income less than $\$ 50,000$.

Households reporting income between $\$ 50,000$ and $\$ 74,999$ make the most HBW trips ( 15.9 percent) and those reporting less than $\$ 25,000$ annual income make the least number of HBW trips ( 11.1 percent). The percentage of HBW trips decreases in households with reported income in excess of $\$ 75,000$ from the high of $\$ 50,000-\$ 74,999$ households. This may be the result of the type of work done (e.g., professional versus retail jobs) and the ability to telecommute in some of the higher paying careers.

Figure 16: NCTCOG Region trip purpose by household income

As expected, Table 11 shows that drivers make more trips than non-drivers. In fact they make nearly twice as many trips each day as do their non-driving counterparts.

Table 11: NCTCOG Region trips by driver status

|  | Appropriate <br> Skip | Not <br> Ascertained | Driver | Not a driver |
| :--- | ---: | ---: | ---: | ---: | ---: |
| Total Number of Daily Trips | $3,084,225$ | 2,971 | $19,026,355$ | $1,111,548$ |
| Total Number of Persons | $1,458,811$ | 1,000 | $4,377,632$ | $48,225,099$ |
| Average Number of Daily Trips Per Person | $\mathbf{2 . 1}$ | $\mathbf{3 . 0}$ | $\mathbf{4 . 3}$ | $\mathbf{6 , 3 2 5 , 9 4 6}$ |

When trip purpose is examined by driver status in Figure 17, it is found that drivers make 5.9 times the number of HBW trips than do non-drivers and non-drivers make almost half as many more HBO trips than do drivers. Drivers lead trip purpose share for HBW and NHB trips and these two purposes account for 48.2 percent of their trips.

Figure 17: Trip purpose by driver status

When examining the daily trips by mode of travel and annual household income in Table 12, it is no surprise that the majority of trips in the region were made in a personal vehicle ( 89.8 percent).
Households reporting annual income of $\$ 100,000$ or more were responsible for 37.8 percent of the trips made in the NCTCOG region. The least number of trips were made by households making less than $\$ 25,000$. The percentage of trips made by households in the remaining three categories, $\$ 25,000$ to $\$ 99,999$, were similar to each other ( 16 to 18 percent).

Table 12: NCTCOG Region daily trips by mode of travel by annual household income

| Annual | Under | $\$ 25,000-$ | $\$ 50,000-$ | $\$ 75,000-$ |  |  |
| ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| Household | $\$ 25,000$ | $\$ 49,999$ | $\$ 74,999$ | $\$ 99,999$ | $\mathbf{\$ 1 0 0 , 0 0 0 +}$ | Total |
| Income |  | 460 | 47,782 | - | 377 | 34,016 |

Figure 18 shows that most vehicle trips are made with a single occupant (58.7 percent) and that less than eight percent of all trips have four or more persons in the vehicle.

Figure 18: NCTCOG Region vehicle occupancy by number of people

When trip purpose is examined with vehicle occupancy in Figure 19, 91.9 percent of all HBW trips are single occupancy trips. HBO trips are more likely to have more than one person in the vehicle than any other trip purpose ( 61.2 percent), followed closely by HBSOCREC trips ( 55.7 percent). Still, these data show that most trips in the region are made with one or two occupants in the vehicle.

Figure 19: NCTCOG Region trip purpose by number of people in private vehicles

Another important element in understanding travel is knowing when people travel. Figure $20^{7}$ shows that the single, peak travel hour in the NCTCOG region is 7:00 to 8:00 am when 10.3 percent of all daily trips occur. However, the evening rush extends for several hours, from 3:00 until 7:00 pm. During these four hours, 34.5 percent of all trips occur; 11.1 percent more than the morning peak times between 6:00 and 10:00 am . When you consider the number of HBO and NHB trips that take place across the region, combined with the evening peak beginning at 3:00 pm it is likely that the workers and non-workers are traveling together during this period of the day.

Figure 20: NCTCOG Region daily trips by time of day

Figure 21 shows that 19.7 percent of all HBO trips are made during the peak travel hour of 7 a.m. and another 13.8 percent of HBO trips occur at the beginning of the afternoon peak travel period ( $3 \mathrm{p} . \mathrm{m}$.). Most HBW trips are reported in the $7 \mathrm{a} . \mathrm{m}$. hour ( 15.2 percent) and in the $5 \mathrm{p} . \mathrm{m}$. hour ( 12.5 percent). NHB trips spike at 11.5 percent in the noon hour. These HBO and HBW percentages may likely present a much different picture of daily travel when examined as tours, as HBO trips may actually be part of HBW tours.

[^5]Figure 21 : NCTCOG Region trip purpose by time of day

Table 13 presents the percentage of trips by hour and purpose and Table 14 the count of the same data. Notice that while most morning HBW trips originate in the 6 and 7 a.m. hours, 4.9 percent begin in the 5 a.m. hour.

Table 13: NCTCOG Region percentage of trips by hour and purpose

In Figure 22 trip times by gender is presented. Little differences in pattern of trip making by hour are observed by gender; however, females do make more trips in the morning and afternoon peak hours of 7 a.m. and $3 \mathrm{p} . \mathrm{m}$. Table 15 provides the number of trips and percentages for gender by hour.

Figure 22: NCTCOG Region trip times by gender

Table 15: NCTCOG Region number and percentage of trips by hour and gender

| Male |  |  | Female |  |
| :--- | ---: | ---: | ---: | ---: |

| 10:00 p.m. or later | 271,290 | $2.5 \%$ | 179,030 | $1.5 \%$ |

As shown in Table 16, 63.9 percent of all trips in the region took 15 minutes or less. Personal vehicle trips account for 88.3 percent of all trip modes. Aside from personal vehicles, only school bus ( 1.7 percent) and walk trips ( 7.2 percent) had a mode share above one percent. Of the walk trips, 74.2 percent were 15 minutes or less.

As noted in Figure 23 and Table 17, trip length tends to have short durations of less than 16 minutes with the notable exception being HBW trips.

Figure 23: NCTCOG Region trip purpose by trip length

Table 17: NCTCOG Region trip purpose by trip length in minutes

| Trip Purpose |  |  |  |  |  |  |  |

| 91-120 minutes | 0.0\% | 0.0\% | 0.1\% | 0.1\% | 0.2\% | 0.0\% | 0.4\% |
| 121+ minutes | 0.1\% | 0.1\% | 0.0\% | 0.1\% | 0.5\% | 0.0\% | 0.8\% |
| Average | 17.8\% | 10.5\% | 13.6\% | 28.0\% | 30.1\% | 0.0\% | 100.0\% |

In Figure 24, further investigation of HBW are presenting by displaying HBW trips by trip length. While the majority of trips in the region took 15 minutes or less ( 6.3 .9 percent), only 33.8 percent of all HBW trips took less than 15 minutes. About 35 percent took between 16 and 30 minutes, and almost 31 percent took 31 minutes or more.

Figure 24: HBW trips by trip length

## Considerations for the future

While many similarities in the overall observed travel behavior patterns exist between the NCTCOG and NHTS datasets, transportation planners will need to carefully evaluate beyond the scope of this report how well the NHTS data suits the needs of the NCTCOG MPA. The differences between the NCTCOG and NHTS data observed in this brief analysis indicate that the exclusions to the dataset made in Tasks 3 and 4 did factor into the observed results. For example, the revised NCTCOG dataset resulted in an average of 2.24 more daily trips per household than were found in the national dataset, suggesting that weekend travel disguises the results needed to make decisions about peak travel behavior. More detailed analysis is required to determine if the results achieved in this effort should be employed moving forward.

## Special notes:

Warning: In the course of evaluating the NHTS data Westat discovered some variables in the NHTS datasets that should be used with caution.

- TDWKND was created by FHWA and is clearly described in the derived variables documentation; however, the label used in the NHTS Public Use Codebook could be misleading. FHWA created this flag to capture travel that started at 6 pm or later on Friday and up to 12 am on Sunday.
- HHMEMDRV used in conjunction with DRVR_FLG is not reliable.

## Appendix A: Deliverables

Each deliverable listed in this appendix is provided on the final deliverable DVD.

## Task 1 Deliverables

The following deliverables have been submitted to NCTCOG and are referenced in this final documentation report.

## Working documents:

Task 1 - Findings Webinar 022013 FINAL.pdf
Final documents:
TASK 1- Final Report_060713.doc
Final Report Memo.pdf

Supporting documentation from FHWA:
These files were part of the original NHTS data deliverable to Federal Highway Administration (FHWA) and were provided to NCTCOG by permission of FHWA NHTS program manager.

Sample Design_May_20.pdf
Supplemental Weighting Plan - Approved 090310.pdf
Task N-Weighting Report.pdf
UsersGuideV2.pdf
Supporting documentation from Westat:
As part of Task 1, Westat provided NCTCOG with additional details related to the weighting procedures used with enhance weights provided to FHWA in 2010. Specifically, output from the rake-trim procedure was provided.

TX_HH_Rake_Trim_flag3_Xtract.lst
TX_PP_Rake_Trim_flag3_Xtract.lst

## Task 2 Deliverables

The following deliverables have been submitted to NCTCOG and are referenced in this final documentation report.

## Working documents:

Task 2 Memo 031212.pdf
Task 2 Memo Data Edits Review.pdf

Final dataset:
NHTS-2009-NCTCOG-2013-06-19.zip

Final documents:
NCTCOG-NHTS-Task 2-Check-Results-Memo-2013-06-19.pdf
NCTCOG-NHTS-CheckResults-2013-06-17.zip - contents of this zip file included:
$>$ NCTCOG-NHTS-CheckResults-2013-06-17.accdb
$>$ NCTCOG-NHTS-EditChecks-with-names-2013-06-17.xlsx
Table 2 Non-Response Checks
Table 3 Range Checks
Table 4 Accuracy and Logic Checks
Table 5 Consistency Checks
> RegeocodedLocations.accdb

## Task 4 Deliverables

Working documents:
NCTCOG_NHTS Preliminary Analysis.pptx

## Final documents:

Task 4 Technical Memo FINAL.pdf

Final datasets:
Core_Data_Files.zip
Data_Dictionary.xls
HHTYPE.DBF
LINKEDTRIPS.DBF
PERTYPE.DBF
SUBTOUR.DBF
TOUR.DBF
UNLINKEDTRIPS.DBF

## Task 3 Deliverables

No formal deliverables were included for this task.

## Task 5 Deliverables

## Final documents:

Literature Review on Weighting Procedures 08012013.pdf
Weighting Report_Final.docx

## Task 6 Deliverables

Working documents:
ListofTables_Final.docx

Final documents:
HHtables_trips.xlsx
Modetables.xlsx
Persontables_opinioninfo.xlsx
Persontables_otherinfo.xlsx
Persontables_trips.xlsx
Triplengthtables.xlsx
Vehicleoccupancytables.xlsx
Vehicletables_HHvehiclecount.xlsx
Vehicletables_trips.xlsx

## Task 7 Deliverables

Final documents:
2009 FARS Makes and Models.pdf
Codebooks:
NCTCOG Household Codebook (weekday)_FINAL.pdf
NCTCOG Locations Codebook (weekday)_FINAL.pdf
NCTCOG Person Codebook (weekday)_FINAL.pdf
NCTCOG Trip Codebook (weekday)_FINAL.pdf
NCTCOG Vehicle Codebook (weekday)_FINAL.pdf
Final Report

## Appendix B: Household-Level Raking Cells

Number of workers by number of vehicles by county of residence

Note: South consists of Ellis and Johnson Counties, West consists of Hood, Parker, and Wise Counties, East consists of Hunt, Kaufman, and Rockwall Counties, Core consists of Collin, Dallas, Denton, and Tarrant Counties, Non-Core consists of Ellis, Hood, Hunt, Johnson, Kaufman, Parker, Rockwall, and Wise Counties

[^0]:    ${ }^{1} 2006$ - 2011 five year ACS data used.

[^1]:    ${ }^{3}$ All tables and figures present weighted data.
    ${ }^{4}$ When possible, comparative NHTS data is included in this report.
    ${ }^{5}$ The trips for the 2009 NHTS represents 365 travel days, the NCTCOG data represents 239 travel days.

[^2]:    Source for NHTS data: Federal Highway Administration, 2009 National Household Travel Survey (NHTS)

[^3]:    ${ }^{6}$ HBSHOP $=$ home-based shopping; HBSOCREC $=$ home-based social/recreational; HBW $=$ home-based work; HBO $=$ home-based other; $\mathrm{NHB}=$ non-home-based; $\mathrm{OTHER}=$ not able to categorize.
