A green street can be defined as a street designed to:

- integrate a system of storm-water management within its right of way
- reduce the amount of water that is piped directly to streams and rivers
- be a visible component of a system of “green infrastructure” that is incorporated into the aesthetics of the community
- make the best use of the street tree canopy for storm-water interception as well as temperature mitigation and air quality improvement
- ensure the street has the least impact on its surroundings, particularly at locations where it crosses a stream or other sensitive area
